Benchmark Sediment Monitoring Program for Illinois Streams: Data Report for Water Years 1994 and 1995

by Richard L. Allgire
Watershed Science Section

Abstract

The Benchmark Sediment Monitoring Program for Illinois Streams was initiated by the Illinois State Water Survey in 1981 to generate a long-term database of suspended sediment transport. The program is now part of the Water Survey's Water and Atmospheric Resources Monitoring (WARM) Network, which monitors the climate, soil moisture, surface water, ground water, and sediment throughout Illinois. This report summarizes the suspended sediment data collected for the program during Water Years 1994 and 1995. All the techniques used in the data collection process and laboratory analyses are based on U.S. Geological Survey procedures and techniques. The report appendices present tables of instantaneous suspended sediment measurements, particle size analysis, sediment transport curves, and plots of instantaneous sediment concentrations for the period of record for the current monitoring stations.

Benchmark Sediment Monitoring Program for Illinois Streams: Data Report for Water Years 1994 and 1995

by Richard L. Allgire
Watershed Science Section

Introduction

The Illinois State Water Survey (ISWS) initiated the Benchmark Sediment Monitoring Program in 1981 to monitor and quantify the long-term changes in suspended sediment concentrations and loads in Illinois waterways. The data collected for this program can assist in evaluating the management of the state's land and water resources. This report presents an analysis and summary of the suspended sediment data collected during Water Years 1994 and 1995. A complete overview of the sediment program, including a description of the monitoring sites, can be found in the report, *Benchmark Sediment Monitoring Program for Illinois Streams: Program Summary and Site Descriptions* (Allgire and Demissie, 1995). Results from prior water years have been published in reports by Bonini et al. (1983), Davie (1988, 1989, and 1990), and Allgire (1997).

Acknowledgments

The Benchmark Sediment Monitoring Program is one of several components that comprises the Water and Atmospheric Re sources Monitoring (WARM) Network. The data compilation and reporting are part of the author's regular duties for the Illinois State Water Survey.

The author wishes to acknowledge Paul Nelson, who is responsible for the data collection for the monitoring sites in central Illinois. Expressed appreciation goes to the Illinois Division of the U.S. Geological Survey for supplying the stream discharge rating tables necessary for data computations.

Becky Howard and Dawn Amrein prepared the camera-ready copy of the report, Eva Kingston and Agnes Dillon edited it, and Becky Howard and Linda Hascall helped prepare the graphs and maps.

Sediment Monitoring Program

Current Program Status

The primary purpose of the Benchmark Sediment Monitoring Program is to collect suspended sediment concentrations at selected stream locations throughout Illinois. These data are used to compare changes in suspended sediment concentrations and loads at individual sampling sites over a long period of time.

When the program began in 1981, there were 50 sampling stations strategically distributed throughout the state. Subsequent budget reductions, sampling site evaluation, and streamlining of the program reduced the number of stations over the next several years. During the mid-1980s, the number of sampling stations declined to 18. By 1992, the number of sampling stations had dwindled to nine, due to equipment shortages, lack of personnel, and bridge reconstruction at various locations. The Benchmark Sediment Monitoring Program currently consists of 15 sampling sites statewide. Figure 1 shows the number of active sampling stations per water year since the beginning of the sediment monitoring program in 1981.

Water Years 1994 and 1995 brought the restart of one station that had been out of service for several years and the start-up of a new station. The Spoon River at London Mills, which had been out of service for several years, was restarted in Water Year 1994. The Kishwaukee River near Perryville was replaced with the Cache River at Ullin in Water Year 1995. The Cache River at Ullin had several years of sample data from Water Years 1986 to 1990 under a research project

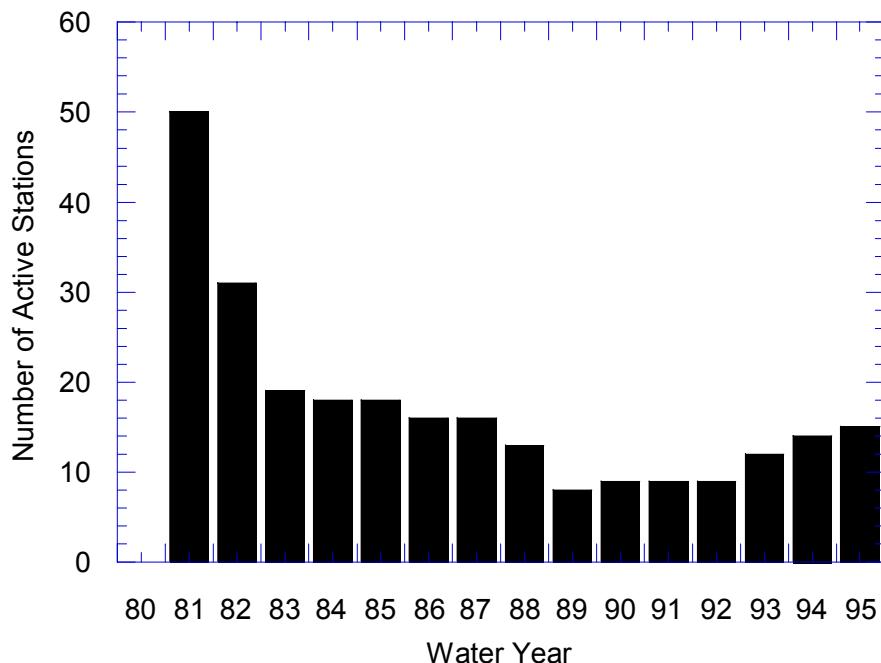

Figure 1. Number of active Benchmark Sediment Monitoring stations

sponsored by the state. This site differs from the rest of the Benchmark Sediment Monitoring Program sites in that it is not a U.S. Geological Survey (USGS) streamgaging station. The ISWS collects and analyzes the streamflow data at this station. A detailed description of the Cache River stations and data can be found in the report, *Cache River Basin: Hydrology, Hydraulics, and Sediment Transport, Volume 1: Background, Data Collection, and Analysis* (Demissie et al., 1990).

Additionally, sampling was temporarily suspended at the Sangamon River at Monticello for Water Year 1995 due to the Department of Transportation bridge reconstruction. Sampling at the Monticello site is scheduled to resume upon completion of the bridge.

Data Collection

The Benchmark Sediment Monitoring Program uses techniques based upon and similar to the sediment data collection techniques developed by the USGS. Detailed descriptions of these techniques can be found in the series Techniques of Water-Resources Investigations of the U.S. Geological Survey (Guy, 1969; Guy and Norman, 1970; Porterfield, 1972).

All of the suspended sediment sampling stations, with the exception of the Cache River at Ullin, are located at USGS continuous recording streamgaging stations. The Cache River at Ullin sediment sampling station is located at a continuous streamgaging station maintained by the ISWS. This enables sampling personnel to read the corresponding river stage when they collect a suspended sediment sample. The USGS furnishes the ISWS with updated water discharge rating tables for each station on an annual basis. The ISWS streamgaging station rating table is developed and updated annually by ISWS personnel. Then, during analysis of the sediment data, an instantaneous water discharge can be assigned to each sample based upon the stage of the river at the time of sampling.

Table 1 lists the active Benchmark Sediment Monitoring Program sampling sites for Water Years 1994 and 1995. This table lists the ISWS and USGS identification numbers, the name of each station and the identifying city, the drainage area for each station, and the period of record. Figure 2 depicts the location of each station in Illinois.

Each sampling site is installed on a bridge crossing the river, and consists of a California-style sediment box with a cable-reel and a sediment sampler. Most of the samplers in use on the network are depth-integrated DH 59s. The bridge sampling locations were placed as close to the approximate channel thalweg as possible when the sampling equipment was set up at each site. Single vertical, depth-integrated samples are collected on a weekly basis by local observers, who are paid a small per-sample fee. The observers collect their samples at a time each week that is conducive to their personal schedule. These samples are then collected periodically by ISWS personnel and transported to the ISWS Sediment Laboratory in Champaign.

Most sites also have calibration cross-sectional sampling done on a periodic basis. Cross-sectional sampling consists of a series of samples that are collected at selected intervals across

the width of the stream. These samples are analyzed individually. The concentrations for all the samples in a cross section are then computed to determine the average sediment concentration for the cross section. These data can then be compared to the single vertical weekly samples to verify that the single vertical samples accurately represent the actual sediment loads in the rivers. In addition, alternate collections of cross sections are composited and analyzed for particle size. The particle size analysis consists of a sand/fine split and is reported as percent finer than 0.0625 millimeters. However, some sites are cross sectioned irregularly, or not all due to a shortage of regional personnel and other time commitments. More detailed information on the sampling and analysis procedures for the sediment monitoring network can be found in the ISWS publication, *Statewide Instream Sediment Monitoring Program for Illinois: Annual Report - Water Year 1981* (Bonini et al., 1983).

Data Analysis

The collected suspended sediment samples are analyzed for concentration and particle size at the ISWS Sediment Laboratory in Champaign. After the analysis has been completed, the sample information and concentrations are screened for quality control. Questionable sample information that cannot be rectified is either discarded or flagged. If no suitable explanation can be deduced for questionable data, the values are marked with an asterisk (*) and left in the data set. Data marked as such should be used cautiously in any further analysis. The abbreviation of the questionable sample component is included in a remarks column adjacent to the information for that particular sample.

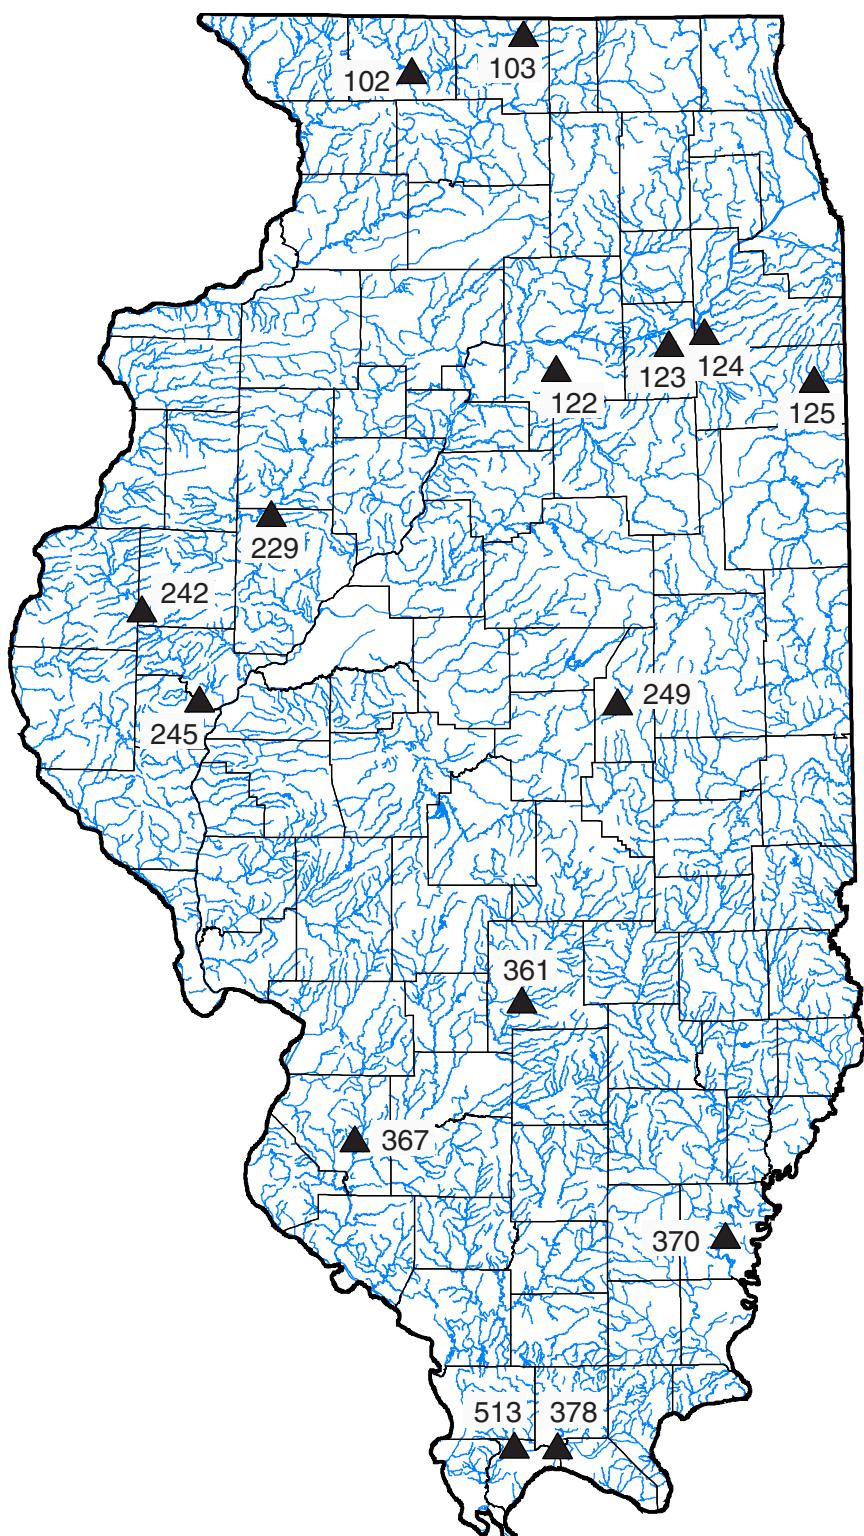

Figure 2. Location of Benchmark Sediment Monitoring stations,
Water Years 1994 and 1995

When the samples have been screened for quality control, instantaneous stream discharge is matched with the gage height for each sample. The instantaneous sediment loads are then calculated using the formula:

$$Q_s = C_s (Q_w) K \quad (1)$$

where Q_s is the instantaneous suspended sediment load in tons per day, C_s is the suspended sediment sample concentration in milligrams per liter, Q_w is the instantaneous water discharge in cubic feet per second, and K is a coefficient with a value of 0.0027. After these calculations have been completed, the data are formatted and compiled into data sets for inclusion in appendix A of this report.

Additionally, each data set contains analysis of any particle size samples that were collected during the water year (see appendix B). Appendix C presents graphs of the sediment load versus water discharge for Water Years 1994 and 1995, and appendix D contains graphs of the sediment concentration values over the complete sampling record for each station.

Summary

The ISWS initiated the Benchmark Sediment Monitoring Program in 1981 to monitor and quantify the long-term changes in suspended sediment concentrations and sediment loads in Illinois waterways. The program began with 50 monitoring stations distributed throughout Illinois. During Water Years 1994 and 1995, 15 stations were monitored.

The monitoring program involves the collection of weekly suspended sediment samples by local private citizens. Calibration samples and particle size data are collected by ISWS personnel to supplement the weekly data. The suspended sediment sample concentrations are paired with the instantaneous water discharge for calculation of the instantaneous sediment load (in tons per day).

Appendix A: Instantaneous Suspended Sediment Measurements

Data Set Parameters

Gage Ht: Gage height, in feet, at the time of sample collection as read from the U.S. Geological Survey or Illinois State Water Survey streamgaging station.

Temp (°C): Water temperature, in degrees Celsius, at the time of sample collection.

Cs (mg/l): Concentration of the collected suspended sediment sample, in milligrams per liter.

Qw (cfs): Instantaneous water discharge of the stream, in cubic feet per second, at the time of sample collection, taken from the U.S. Geological Survey or Illinois State Water Survey stream discharge rating tables.

Qs (t/d): Instantaneous sediment load, in tons per day.

Remarks: Values flagged with an asterisk (*) in this column indicate questionable data. For example, *Cs indicates a questionable suspended sediment concentration.

-: A dash (-) in any data column indicates the data are missing for that parameter.
