Benchmark Sediment Monitoring Program for Illinois Streams

Data Report for Water Years 1998 and 1999

by
Richard L. Allgire
Watershed Science Section

Abstract

The Benchmark Sediment Monitoring Program for Illinois Streams was initiated by the Illinois State Water Survey in 1981 to generate a long-term database of suspended sediment concentrations and instantaneous sediment loads. The program is now part of the Water Survey's Water and Atmospheric Resources Monitoring (WARM) Network, which monitors climate, soil moisture, surface water, groundwater, and sediment throughout Illinois. This report summarizes the suspended sediment data collected for the program during Water Years 1998 and 1999. All the techniques used in the data collection process and laboratory analyses are based on U.S. Geological Survey procedures and techniques. The report appendices present tables of instantaneous suspended sediment measurements, particle size analysis, sediment transport curves, and plots of instantaneous sediment concentrations for the period of record for the current monitoring stations.

Keywords: Benchmark Sediment Monitoring, data collection, Illinois streams, sedimentation, suspended sediment, sediment concentration, particle size distribution.

Benchmark Sediment Monitoring Program for Illinois Streams: Data Report for Water Years 1998 and 1999

by
Richard L. Allgire
Watershed Science Section

Introduction

The Illinois State Water Survey (ISWS) initiated the Benchmark Sediment Monitoring Program in 1981 to monitor and quantify the long-term changes in suspended sediment concentrations and loads in Illinois waterways. The data collected for this program can assist in evaluating the management of the state's land and water resources. This report presents an analysis and summary of the suspended sediment data collected during Water Years 1998 and 1999. A complete overview of the sediment program, including a description of the monitoring sites, can be found in the report *Benchmark Sediment Monitoring Program for Illinois Streams: Program Summary and Site Descriptions* (Allgire and Demissie, 1995). Results from prior water years have been published in reports by Bonini et al. (1983), Davie (1988, 1989, and 1990), and Allgire (1997, 2001a, 2001b).

Acknowledgments

The Benchmark Sediment Monitoring Program is one of several components that comprises the Water and Atmospheric Resources Monitoring (WARM) Network. The data compilation and reporting are part of the author's regular duties for the Illinois State Water Survey.

The author wishes to acknowledge Paul Nelson, who is responsible for the data collection for the monitoring sites in central Illinois. Expressed appreciation goes to the Illinois Division of the U.S. Geological Survey (USGS) for supplying the stream discharge rating tables necessary for data computations.

Patti Hill and Linda Dexter prepared the camera-ready copy of the report, which Eva Kingston edited.

Sediment Monitoring Program

Current Program Status

The purpose of the Benchmark Sediment Monitoring Program is to collect suspended sediment concentrations at selected stream locations throughout Illinois. These data are used to compare changes in suspended sediment concentrations and loads at individual sampling sites over a long period of time.

When the program began in 1981, there were 50 sampling stations strategically distributed, and streamlining of the program reduced the number of stations over the next several years. During the mid-1980s, the number of sampling stations declined to 18. By 1992, the number of sampling stations had dwindled to nine due to equipment shortages, lack of personnel, and bridge reconstruction at various locations. The Benchmark Sediment Monitoring Program currently consists of 15 sampling sites statewide. Figure 1 shows the number of active sampling stations per water year since the beginning of the sediment program in 1981.

Table 1 lists the active Benchmark Sediment Monitoring Program sampling sites for Water Years 1998 and 1999. This table lists the ISWS and USGS identification numbers, the name of each station and the identifying city, the drainage area for each station, and the period of record. Figure 2 depicts the location of each station in Illinois.

378	Cache R. at Forman	03612000	244	1981 - Present
513	Cache R. at Ullin	-	164	1986 - 1989, 1995-Present

Sediment sampling was temporarily suspended at site #123, Mazon River near Coal City, at the beginning of the 1998 Water Year. The bridge on which this sampling station is located was scheduled for reconstruction. Sampling is suspended at bridge reconstruction sites in consideration of safety for local citizen observers. The bridge replacement schedule was delayed, and no samples were collected for Water Years 1998 and 1999. Sampling at the Mazon River site has been reinstated for Water Year 2002.

Data Collection

The Benchmark Sediment Monitoring Program uses techniques based upon the sediment data collection techniques developed by the USGS. Detailed descriptions of these techniques can be found in the U.S. Department of the Interior series Techniques of Water-Resources Investigations of the U.S. Geological Survey (Guy, 1969; Guy and Norman, 1970; Porterfield, 1972).

All suspended sediment sampling stations, with the exception of the Cache River at Ullin, are located at USGS continuous recording streamgaging stations. The Cache River at Ullin sediment sampling station is located at a continuous streamgaging station maintained by the ISWS.

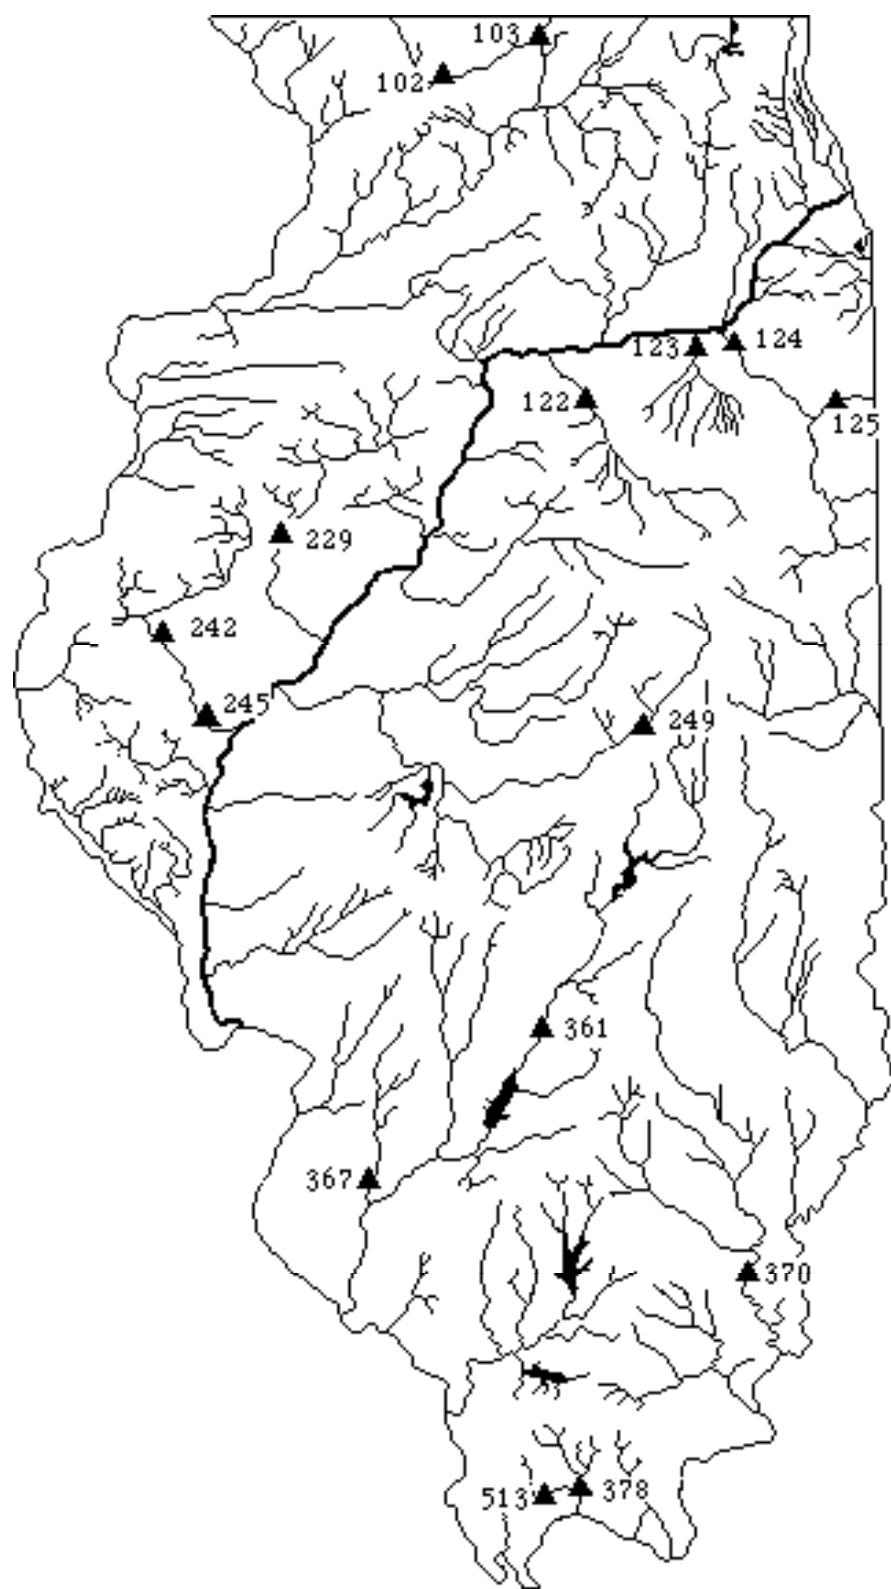

Figure 2. Location of Benchmark Sediment Monitoring stations,
Water Years 1998 and 1999

Locating sampling stations at streamgaging stations enables sampling personnel to read the corresponding river stage when they collect a suspended sediment sample. The USGS furnishes the ISWS with updated water discharge rating tables for each station on an annual basis except for the Cache River at Ullin. The rating table for this station is developed and updated annually by ISWS personnel. During analysis of the sediment data, an instantaneous water discharge taken from the rating table can be assigned to each sample based upon the stage of the river at the time of sampling.

Each sampling site is installed on a bridge crossing the river, and consists of a California-style sediment box with a cable-reel and a sediment sampler. Most of the samplers in use on the network are depth-integrated DH 59s. Bridge sampling locations were placed as near to the approximate channel thalweg as possible when the sampling equipment was set up at each site. Single vertical, depth-integrated samples are collected on a weekly basis by local observers who are paid a small per-sample fee. The observers collect their samples at a time each week that is conducive to their own personal schedule. These samples are then collected periodically by ISWS personnel and transported to the ISWS Sediment Laboratory in Champaign.

The observer sampling schedule has changed since the origin of the program in 1981. During Water Year 1981, observers at 10 of the 15 current sampling stations collected daily samples for the months of April through July with weekly samples collected the remaining months of the year. Additionally, during the April to July period of that first year, the observer collected a second sample on days of rising river stages. Budget cuts the following years of the program curtailed the daily spring sampling resulting in only weekly sampling for the program. More detailed information on the sampling and analysis procedures for the sediment monitoring network can be found in the ISWS publication *Statewide Instream Sediment Monitoring Program for Illinois: Annual Report - Water Year 1981* (Bonini et al., 1983).

Most of the sampling sites also have calibration cross-sectional sampling done on approximately a six-week interval by ISWS field staff. Cross-sectional sampling consists of collecting a series of samples at selected intervals across the width of the stream. These samples are analyzed individually. The concentrations for all the samples in a cross section are then computed together to determine the average sediment concentration for the cross section.

Additionally, the SWS technician collects discreet samples from the observer sampling locations at the beginning and end of each cross-section sampling. These discreet additional samples are included in the Appendix A data set and occasionally results in multiple samples on any given day.

These data can then be compared to the single vertical weekly samples to verify that the single vertical samples accurately represent the actual sediment loads in the rivers. In addition, every other cross section is analyzed for particle size. The particle size analysis consists of a sand/fine split and is reported as percent finer than 0.0625 millimeters (mm), with the proportion smaller than 0.0625 mm being fines. Several of

the sites have cross sections collected at irregular intervals or not all due to a shortage of regional personnel and other time commitments.

Data Analysis

The collected suspended sediment samples are analyzed for concentration and percent of sand/fines at the ISWS Sediment Laboratory in Champaign. Once the laboratory analysis has been completed, the sample information and concentrations are screened for quality control. Questionable sample information that cannot be rectified is either discarded or flagged. If no suitable explanation can be deduced for questionable data, the values are marked with an asterisk (*) and left in the data set. Data marked as such should be used cautiously in any further analysis. The abbreviation of the questionable sample component is included in a remarks column adjacent to the information for that particular sample.

Once the samples have been screened for quality control, instantaneous stream discharge is matched with the gage height for each sample. The instantaneous sediment loads are then calculated using the formula:

$$Q_s = C_s (Q_w) K$$

where Q_s is the instantaneous suspended sediment load in tons per day, C_s is the suspended sediment sample concentration in milligrams per liter, Q_w is the instantaneous water discharge in cubic feet per second, and K is a coefficient with a value of 0.0027 that is based on the unit of measurement of water discharge and that assumes a specific weight of 2.65 for sediment (Porterfield, 1972). After these calculations have been completed, the data are formatted and compiled into data sets for inclusion in Appendix A of this report.

Additionally, each data set contains the results of any percent fines/sand computation samples that were performed during the water year (see Appendix B). Appendix C contains graphs of the sediment concentration values over the complete sampling record for each station.

Summary

The Illinois State Water Survey initiated the Benchmark Sediment Monitoring Program in 1981 to monitor and quantify the long-term changes in suspended sediment concentrations and instantaneous sediment loads in Illinois waterways. The program began with 50 monitoring stations distributed throughout Illinois. During Water Years 1998 and 1999 14 stations were actively monitored.

The monitoring program for Water Year 1998 and 1999 involves the collection of suspended sediment samples by trained local private citizens. Calibration samples and particle size data are collected by Water Survey personnel to supplement the weekly data. The suspended sediment sample concentrations are paired with the instantaneous water discharge for calculation of the instantaneous sediment load (in tons per day).

Appendix A: Instantaneous Suspended Sediment Measurements

Data Set Parameters

- Date: Day sample was collected by observer or technician.
- Time: Time sample was collected in 24-hour time.
- Gage Ht: Gage height, in feet, at the time of sample collection as read from the U.S. Geological Survey or Illinois State Water Survey streamgaging station.
- Temp (°C): Water temperature, in degrees Celsius, at the time of sample collection.
- Cs (mg/l): Concentration of the collected suspended sediment sample, in milligrams per liter.
- Qw (cfs): Instantaneous water discharge of the stream, in cubic feet per second, at the time of sample collection, taken from the U.S. Geological Survey or Illinois State Water Survey stream discharge rating tables.
- Qs (t/d): Instantaneous sediment load, in tons per day.
- Remarks: Values flagged with an asterisk (*) in column indicate questionable data. For example, *Cs indicates a questionable suspended sediment concentration. Bw indicates backwater conditions at the time of sampling.
- : A dash (-) in any column indicates that data are missing for that parameter.
