PART E. DIGITAL FLOW MODEL DESCRIPTION AND USER'S GUIDE

for the study

GROUND WATER LEVEL ANALYSIS BY COMPUTER MODELING:
AMERICAN BOTTOMS GROUND WATER STUDY

by

Joseph D. Ritchey, Richard J. Schicht, and Linda S. Weiss

Prepared for and funded by the
U.S. Department of the Army,
St. Louis District, Corps of Engineers

Champaign, Illinois
June 1984

PREFACE

Groundwater Level Analysis by Computer Modeling is an in-depth investigation of groundwater flow in the American Bottoms area. There were five objectives to this study. They were 1) to compile current hydrologic data pertaining to the area, 2) to develop a computer model that could simulate the movement of groundwater, 3) to analyze existing and future groundwater levels in the area, 4) to present alternatives to lower or maintain groundwater levels at specified elevations in a designated area of interest and 5) to provide documentation of the model including a user's guide.

The five objectives of this study are addressed in five separate reports that may be used independently or conjunctively.

<u>Part</u>	<u>Title</u>
A	Groundwater Levels and Pumpage
B	American Bottoms Digital Groundwater Flow Model
C	Existing and Future Groundwater Levels
D	Evaluation of Alternative Measures
E	Digital Flow Model Description and User's Guide

A brief summary of each part of the study is given here. Each part has an introduction, an explanation of methods, results and references. Part E, the model user's guide, includes attachments for data and program listings.

Acknowledgments

A project of this size required the cooperation of many Illinois State Water Survey employees. Their efforts were important in the completion of this project. Noteworthy contributions were made by James D. Miller in gathering background information for Part A, by Mark C. Collins in modifying the ISWS aquifer model for Part B and by Anne Klock in making groundwater level probability exceedance calculations for Part C. Graphics were done by John Brother, Bud Motherway and Linda Riggins. Word processing was done by Pamela Lovett and Kathy Brown. A special appreciation was gained for the timely assistance of consultants at the University of Illinois Computer Services Office and the Boeing Computer Service Customer Service.

SUMMARY OF STUDIES

Groundwater Levels and Pumpage

The American Bottoms is a 175 square mile area of the Mississippi River valley lowlands that includes the urban industrial areas of East St. Louis, Granite City and Alton. Groundwater is a major source of water for the area and is used for industrial, public and irrigation supplies. Groundwater levels prior to industrial and urban development were near land surface. Intensive industrial development and construction of a system of drainage

ditches, levees, and canals to protect developed areas have altered the water resources in the area. In recent years, water level rises due to reductions in pumpage, high river stages, and high precipitation producing favorable recharge conditions have caused damage to underground structures. The U.S. Army Corps of Engineers, St. Louis District has sponsored this study to examine groundwater flow in the area and its relationship to Mississippi River stage and precipitation.

Water levels and pumpage information collected over many years by the State Water Survey have been summarized and are presented in Part A. Pumpage is presented for major and minor pumping centers and is classified as public, industrial, domestic or irrigation. Hydrographs are presented for ten different observation wells for their period of record. Mississippi River stages, precipitation at St. Louis airport and pumpage at Granite City are included with the hydrographs to illustrate their interdependence. Piezometric surface maps are presented for five different groundwater conditions.

Groundwater Flow Model

The groundwater model used was a modified form of the Illinois State Water Survey aquifer model (Prickett and Lonquist, 1971). Modifications were made to incorporate the dynamic effects of river stage and precipitation. The model was calibrated by historically matching two five-year periods with constant one-month time steps. Hydrographs of actual and simulated water levels at ten observation wells and the nearest model cell for the two five-year periods are presented. Two piezometric surface maps of actual and simulated water levels are also presented. The model was found to consistently calculate water levels within two feet of the actual measured water level within a specified area of interest.

Existing and Future Conditions

Groundwater conditions were evaluated by simulating historical Mississippi River stage and precipitation and constant pumpage for a thirty-year period. Pumpage was simulated as 1) constant for the thirty-year period at historical 1980 rates and locations, 2) forecast 2000 rates and locations and 3) no pumpage except for a dewatering site maintained by the Illinois Department of Transportation.

Groundwater levels were evaluated with the aid of groundwater level exceedance probability plots. Groundwater level exceedance probability plots were constructed for ten model cells by compiling the maximum yearly water level from monthly simulated values. Plots were based on simulation of the thirty-year period from 1951 to 1980. The Weibold formula was used for probability calculations.

Mississippi River stage and precipitation records were available from 1905 to the present. One simulation was conducted for a period of 75 years to compare the period of simulation with the length of the exceedance plot. The longer period of record was desirable; however, because low river stages

as well as high river stages and low and high precipitation occur during the thirty-year period from 1951 to 1980, the impact on exceedance is minimal. Also, the cost of simulations dictated use of the shorter period.

Alternative Measures

Pumpage systems and gravity drainage collectors to maintain water levels were evaluated by the same methods used in evaluation of existing and future conditions. Two pumpage and one gravity collector systems were designed to meet three specified groundwater levels. Systems were designed for forecast 2000 pumpage and no pumpage conditions. In all, twenty systems were simulated. Systems were designed to meet the specified target elevation in all cells for 90 percent of the months simulated. Exceedance probability was calculated for ten cells, but is illustrated for only five cells. Piezometric surface maps are presented for June 1973 conditions for designs with year 2000 pumpage.

Digital Flow Model Description and User's Guide

The computer model is documented by sections describing model capabilities, theory and assumptions. Explanation for preparing data files and understanding output is also included, as are three sample problems. Four attachments are provided to: 1) list and explain file names supplied on magnetic tape, 2) list data of all inputs to the model, 3) list the Fortran V source code for the model, and 4) define all variables in the computer code.

The text for Part E, Digital Flow Model Description and User's Guide, follows.

FOREWORD

This manual provides information about the organization and the implementation of the American Bottoms Digital Groundwater Flow Model. It is intended, in part, for use by engineers who are conducting simulations and are modifying data sets, and it is also intended for use by programmers who are implementing the program on a computer system or who are modifying the source code.

Throughout this manual references are made to names of variables used in the computer program. These variables will be capitalized and enclosed in brackets [].

1.0 CAPABILITIES OF THE MODEL

The American Bottoms digital model is a valid representation of groundwater flow and surface water/groundwater interaction. The model incorporates the effects of fluctuating Mississippi River stage and variable recharge conditions in making water level determinations. The model was constructed for the purpose of investigating pumpage schemes and gravity collector drainage plans for controlling groundwater levels in specified areas of interest. The model has been verified for this purpose, within reasonable limits of application.

The model, which includes the computer program and data, permits optional variations in simulations. The limits of variability of simulations are easily defined. The limits of simulations are defined by parameters that are specified in the computer program or in input data. A list of parameters which have a limit is provided as Table 1.

Table 1. Summary of Model Physical Limits

PARAMETER	LIMIT	COMMENT
max. no. of years of simulation	100	program limit
max. no. of pumps	250	program limit
max. no. of years of pump	100	program limit
max. no. of alternative pumps	411	program limit
first year of pumpage	1900	program limit
first year of alternative pumpage	1951	program limit
first year of Mississippi R. stage	1905	data limit
first year of precipitation	1905	data limit
max. no. of iterations	50	program limit

The limits of valid simulation are less well defined. The following section describes constraints on the model that help define the limits of valid simulation.

2.0 THEORETICAL DEVELOPMENT

Good models balance simplicity and accurate approximation of the real flow system with available data. An accurate model of a physical system must represent the physical characteristics of the aquifer, inflow, outflow and movement of water within the system. Sources of inflow considered in this model include water entering the system as: surface water (the Mississippi River); leakage from lakes, streams and canals; precipitation; and inflow through model boundaries (the bluff). Outflow of groundwater from the system includes: leakage to lakes, streams and canals; evapotranspiration; pumpage; and outflow across model boundaries.

Assumptions define the conceptual model by simplifying and defining the conversion from a real system to a mathematical representation. There are two types of assumptions that are applied in this study. These are assumptions that simplify the digital flow model mathematically, and assumptions that approximate hydrologic conditions as they exist in the American Bottoms area. The assumptions that simplify mathematics have been discussed by a number of authors; consequently, they will be briefly described, with more complete justifications referenced. Assumptions made to delineate the hydrologic conditions are termed boundary conditions and are presented in detail.

Assumptions that define the mathematical capabilities of the digital model are: the aquifer is homogeneous and isotropic in the vertical direction; recharge to the water table occurs instantaneously; and vertical flow

components are negligible when compared with horizontal flow components. Justification for these assumptions are given below.

1. The aquifer is homogeneous and isotropic in the vertical direction. Well logs show that the valley fill consists of coarse and fine grained materials. Although there is a disparity of grain sizes present, materials are not divided into separate unrelated zones of high and low conductivity. The assumption that the aquifer is homogeneous and isotropic in the vertical direction allows consideration of the flow system in two dimensions rather than three. Several past models of the area were successfully done in two dimensions applying this assumption.
2. Recharge to the water-table occurs instantaneously. The water table generally occurs at depths less than 20 feet from the land surface. Records from observation wells and rain gages show that a rise in the water-table occurs within a few days after a precipitation event. This is a short length of time compared to the length of a time step used in the simulation of one month (30.44 days). This assumption permits consideration of precipitation as instantaneously affecting to recharge and that it occurs during the month in which it was recorded.
3. Vertical flow components are negligible when compared with horizontal flow components. In general, vertical flow in a water-table aquifer is negligible under typical hydraulic gradients. This assumption, often called the Dupuit-Forchheimer Theory, is described by Wang and Anderson (1982). The hydraulic gradient between the bluff and Mississippi River is approximately .0068 ft/ft or 3.6 feet per mile.

Vertical flow occurs in the vicinity of pumpage in water table conditions. It also occurs along the Mississippi River due to discharge of regional flow. The quantity of vertical flow, however, is small compared to the quantity of horizontal flow.

Assumptions that describe hydrologic conditions as they exist in the American Bottoms are: leakage from underlying indurated rocks is negligible; groundwater flow from west of the Mississippi and Missouri rivers has no direct impact on water levels in the valley aquifer; the Cahokia Diversion Canal and the Prairie Du Pont Diversion Floodway are hydraulically connected to the aquifer, all other canals are not; the Mississippi River stage affects groundwater levels near the river; Horseshoe Lake and Frank Holten Lake are hydraulically connected to the aquifer; and precipitation affects groundwater levels. Justification for these assumptions are given below.

1. Leakage from underlying indurated rocks is negligible. Rocks that lie under the valley fill are predominantly carbonate rocks that are not able to transmit water because they are massive. In the southern part, these rocks may be able to transmit limited quantities of water because the rocks are fractured. There is an insufficient pressure head difference to cause significant flow between the valley fill and the indurated carbonate rocks. This assumption allows treating the bottom of the valley fill as a zero flow boundary.
2. Impact on shallow groundwater located west of the Mississippi and Missouri rivers does not affect water levels east of the rivers. The rivers are lines of discharge and recharge for shallow groundwater. The rivers are a boundary to flow because they are lines of either higher or lower head than the surrounding area. Groundwater flows from high head to low head, and therefore either discharges to

the river or is recharged by the river, thus not impacting water levels on the opposite side. This assumption allows simplification of the area modeled.

3. The Cahokia diversion channel and the Prairie DuPont Floodway are hydraulically connected to the aquifer and all other canals are not. Flow directions illustrated on piezometric surface maps indicate that the canals are hydraulically connected to the aquifer (see Part A, figures 30 to 34). Other canals, including Harding Ditch and Cahokia Canal provide surface water drainage and do not appear to impact water levels in the aquifer.
4. The Mississippi River stage affects groundwater levels near the river. Figure 20 of Part A shows water levels in Well STC 2N10W-33.2f and Mississippi River stages at Jefferson Barracks gage. Monthly average river stage correlates well with monthly groundwater levels, supporting this contention.
5. Horseshoe Lake and Frank Holten Lake impact groundwater levels in the American Bottoms. Horseshoe Lake was a source of recharge during periods of high pumpage in the Granite City area. Frank Holten Lake is also a source of recharge to nearby wells.
6. Precipitation in the American Bottoms area affects groundwater levels. Figure 16 of Part A shows water levels in Well MAD 3N9W-14.2c and precipitation at St. Louis Airport. Monthly total precipitation correlates well with monthly groundwater fluctuation levels.

3.0 COMPUTATIONAL METHODS

The assumptions previously stated establish a conceptual model. The mathematical model is a set of equations that characterize the real system.

The mathematical model used in this study uses a partial differential equation for nonsteady-state, two-dimensional (horizontal) flow in a non-homogeneous and isotropic aquifer. This equation was developed by Bittinger et al. (1967) and its use is described in ISWS Bulletin 55, Prickett and Lonquist (1971).

Solution of the equation is accomplished by methods described in ISWS Bulletin 55 and therefore will not be described in detail. Aquifer and hydrologic properties used in the solution of the flow equation, including recharge, evapotranspiration and various boundary conditions are treated differently than in Bulletin 55, and will consequently be given more discussion.

A general presentation of the modifications to the ISWS Bulletin 55 program were illustrated in figure 1 of Part B. Modifications include: calculation of recharge at river nodes, calculation of recharge and evapotranspiration at land nodes, utilization of annual pumpage data and manipulation of boundary conditions.

Calculation of recharge from the Mississippi River required modification of procedures for determination of induced infiltration as described in Bulletin 55. River nodes in Bulletin 55 are treated as if the head in the river remains constant. This assumption is unsatisfactory for this study. Modifications were made to enable specification of river stage for each time period [ISTEP].

Figure 1 illustrates calculation of river stage at cells. This is performed in subroutine RSTAGE. Cells representing the river are specified by the parameters [RH] (river stage elevation, in ft, for a cell) and [RD] (river bed bottom elevation, in ft, for a cell). Variables required by the modified model include: [RIMM], river mile mark of a cell which relates the cell to known river locations; [RIVER], monthly average Mississippi River

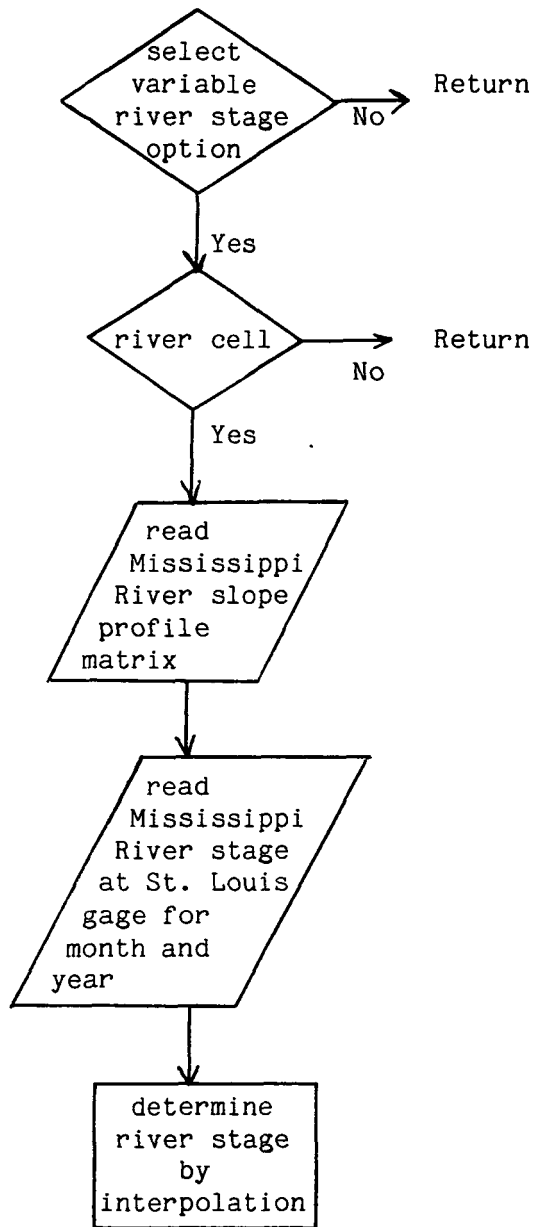

Figure 1. Diagram for calculation of river elevation [RH] at river cells.

stages at St. Louis gage (mile mark 179.6); and [SMAT], Mississippi River slope profile matrix, to relate stages at St. Louis gage to other mile marks.

River stage [RH] at a node is determined for a given month and year by interpolation of Mississippi River slope profiles [SMAT] from Alton, IL to Jefferson Baracks, MO, US Army Corps (1956). The Mississippi River mile mark [RIMM] and the average monthly river stage at St. Louis gage [RIVER] for a given month and year are used for interpolation.

Figure 2 illustrates calculation of recharge factor [R] at river cells. This is performed in subroutine RCHARGE. Recharge factor [R], in gallons per day per foot at each cell representing a river, as input to the model, is calculated as $R = (P'/m')A_s$, where P' is the hydraulic conductivity of the streambed, in gpd/ft^2 , m' is the thickness of the streambed, in feet, and A_s is the area of the streambed assigned to a cell, in square feet. Schicht (1965) presented river bed infiltration rates for the Mississippi River in the American Bottoms area as related to river temperature. Variables required by the modified model include [AYRT] and [AMRT], the average annual and monthly Mississippi River temperatures. A simple ratio of the monthly average river temperature and annual average river temperature is calculated to factor the recharge factor as input and as described by Prickett and Lonquist (1971). The river stage and recharge factor are related with head to determine river bed leakage.

Calculation of recharge and evapotranspiration at land nodes required modification of procedures for determination of groundwater evapotranspiration as described in Bulletin 55. Land nodes in Bulletin 55 are treated as if the recharge factor and withdrawal rate remains constant. As with river nodes, this assumption is unsatisfactory for this study. Modifications were

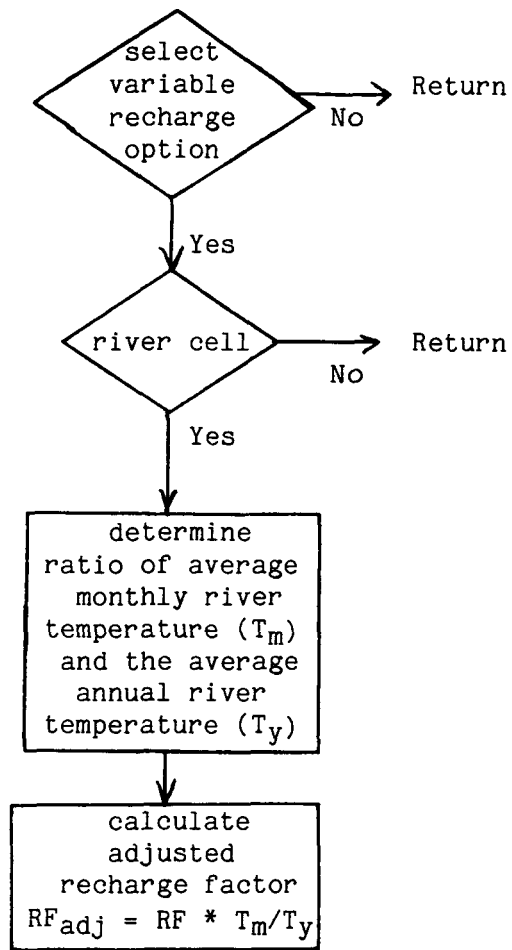

Figure 2. Diagram for calculation of recharge factor [RF] at river cells.

made to enable specification of recharge factor and constant withdrawal rate for each time period.

Figure 3 illustrates the modifications for calculation of recharge factor [R] and constant withdrawal rate [Q] at land cells. This process occurs in the subroutine RCHARGE. Recharge factor [R] is factored by the ratio of recorded monthly total precipitation (at St. Louis Airport), [PVAL], and the thirty year average monthly total, [AMPT], precipitation and by a monthly multiplier, [WR]. The multiplier, [WR], converts the value of [R], which is input as an average recharge factor for an entire year, to a monthly value. The sum of all [WR]'s is 12. Table 2 lists values of [AMPT] and [WR].

Constant withdrawal rate is multiplied by the evapotranspiration factor [ETR] to convert the value of [Q], which is input as an average value for an entire year, to a monthly value. Table 2 lists values of [ETR].

For convenience, pumpage data can be input in three different ways (see figure 4). It may be input as annual estimates attributed to a period of actual years of record. It may be input as annual estimates for a particular year that is applied regardless of the month and year simulated. Or, it may be input as alternative pumpage systems that is applied in addition to one of the other means of input. Alternative pumpage is input for the period from January, 1951, to December, 1980, by quarters of a year. The third quarter (July, August and September) is omitted because of its minimal use in dewatering and to conserve computer memory requirements.

Pumpage is defined by the variable [WELL] in contrast to variable [Q] in Bulletin 55. Determination of which pumpage data are equated to the variable [WELL] is done in the subroutine PUMPAGE. All pumpage values are input in million gallons per day.

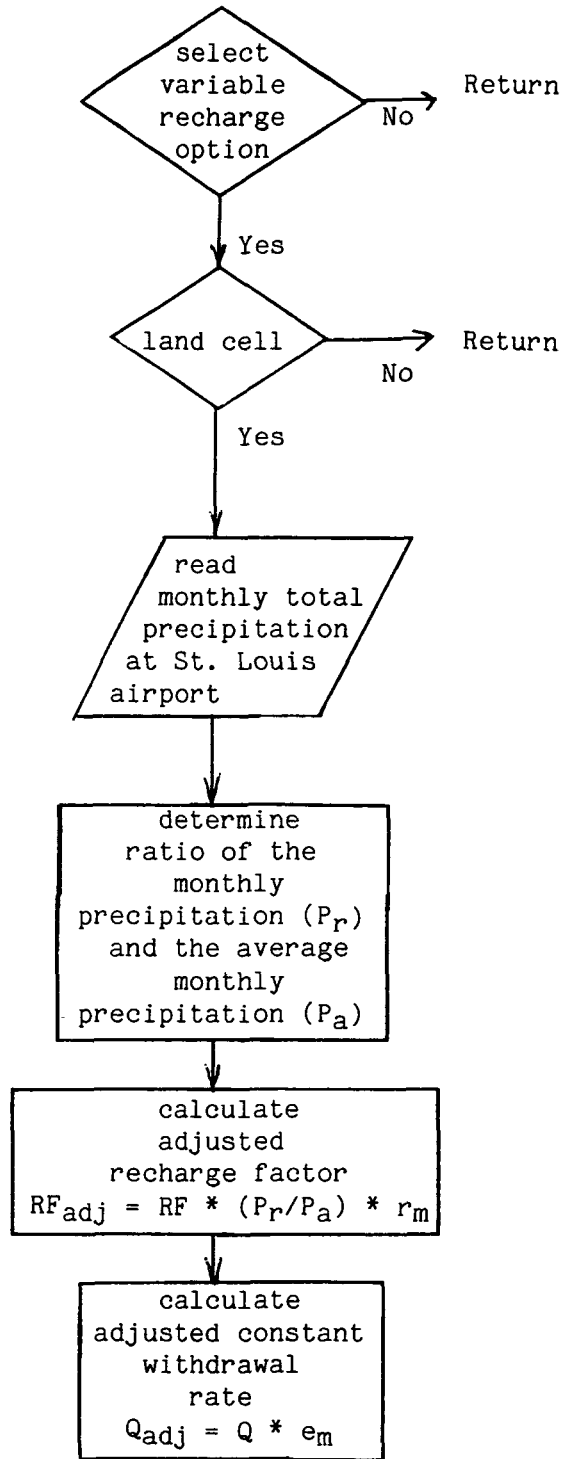

Figure 3. Diagram for calculation of recharge factor [RF] at land cells.

Table 2. Model Variable Values for RCHARGE and RSTAGE

MODEL VARIABLE NAME	MONTHS											
	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
AMRT (OF)	35.	35.	42.	55.	65.	75.	81.	82.	76.	64.	51.	39.
AMPT (in.)	2.2	2.3	3.3	3.7	4.1	4.0	3.3	2.9	3.2	2.6	2.6	2.2
WR	0.7	1.0	3.0	2.5	2.0	1.0	0.5	0.3	0.1	0.2	0.3	0.4
ETR	.24	.34	.68	1.1	1.6	1.8	2.0	1.6	1.2	.79	0.4	.24

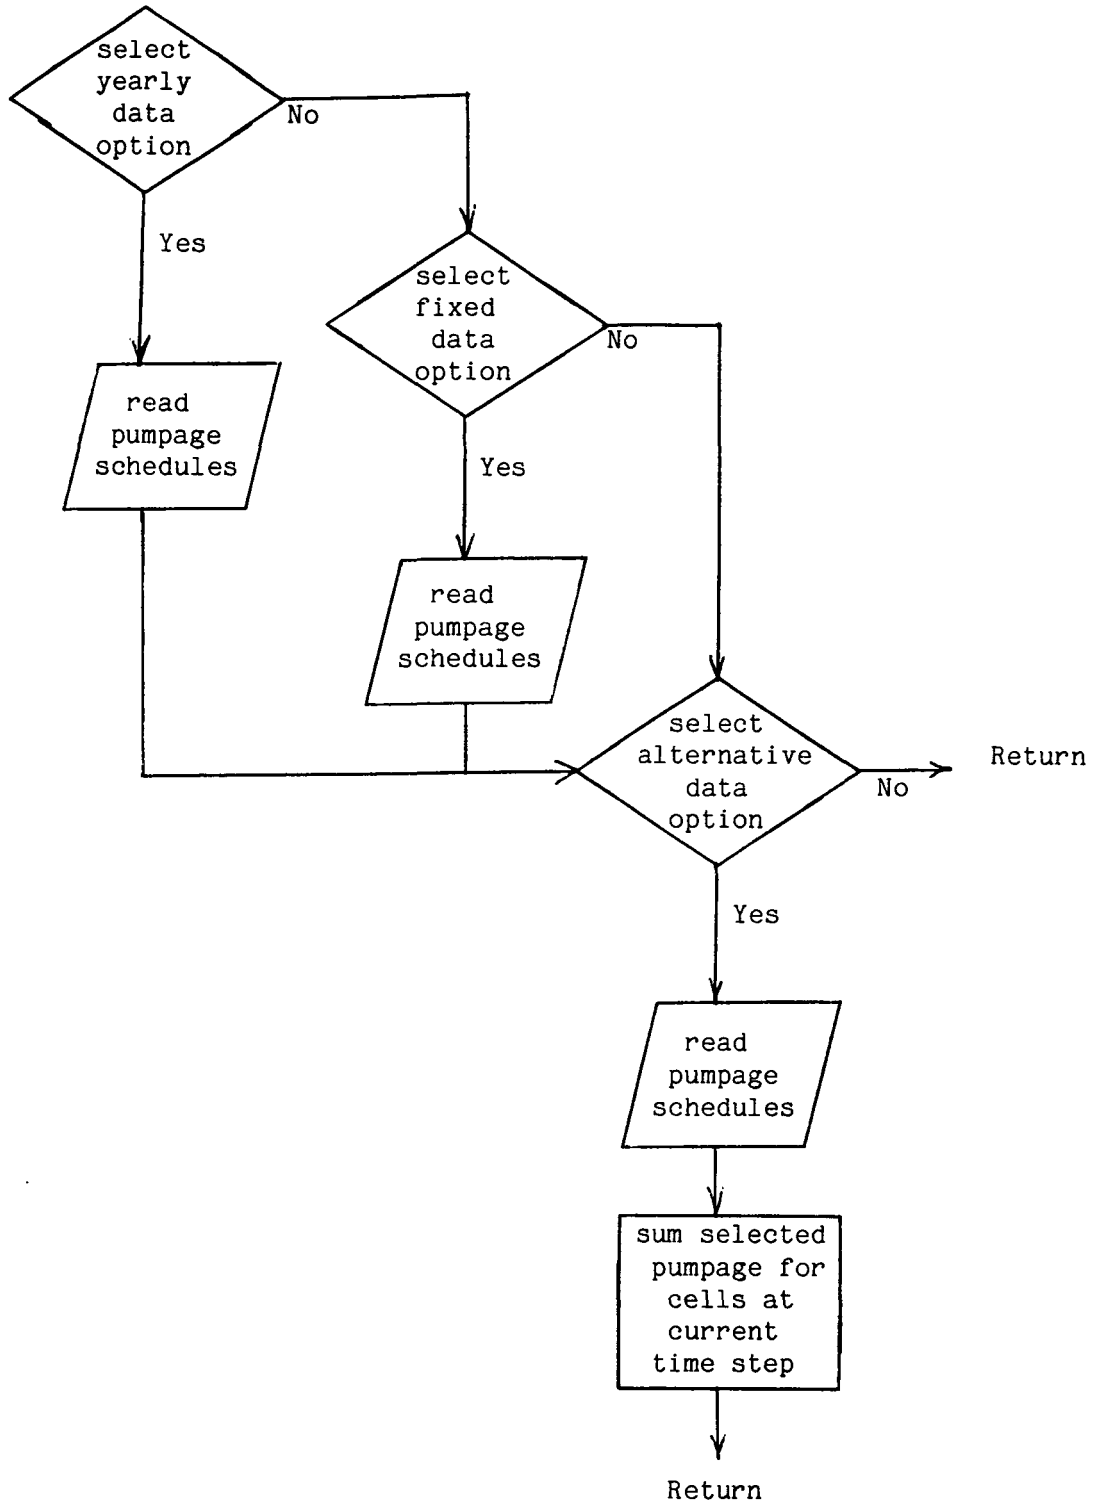

Figure 4. Diagram of inclusion of pumpage data options.

Manipulation of boundary conditions is necessary to accommodate some of the extreme climatic conditions that occurred during the periods simulated. Conditions that are automatically altered in the model include the water level in Horseshoe Lake, the water levels in the bluff and the storage coefficient in areas near the bluff. Parameter changes and the month and year the change is to begin and end is input as called from subroutine CHANGE (see figure 5) .

4.0 PROGRAM IMPLEMENTATION

The program code was written in the Control Data Corporation (CDC) FORTRAN 5 language. Simulations were conducted on a CDC Cyber 175 computer having 262K words of central memory and using the NOS operating system. The program used approximately 80 cpu seconds for each year simulated, depending on the options selected.

The program uses up to 17 input/output files. These files are associated with a specific position in the program execution statement. Table 3 shows the file names and unit numbers used by the program.

Execution of the program should make use of PROCEDURE or COMMAND files to simplify file handling. Figure 6 illustrates a COMMAND file used for execution of the compiled program file called FF00.

Options allow tailoring the simulation and output to meet the needs requiring the model. If certain options are not required modification of the program code will reduce computer memory requirements and computation time. Modifications made are to the size and presence of certain COMMON blocks and to the presence of subroutines. Table 4 presents a description of program subroutines.

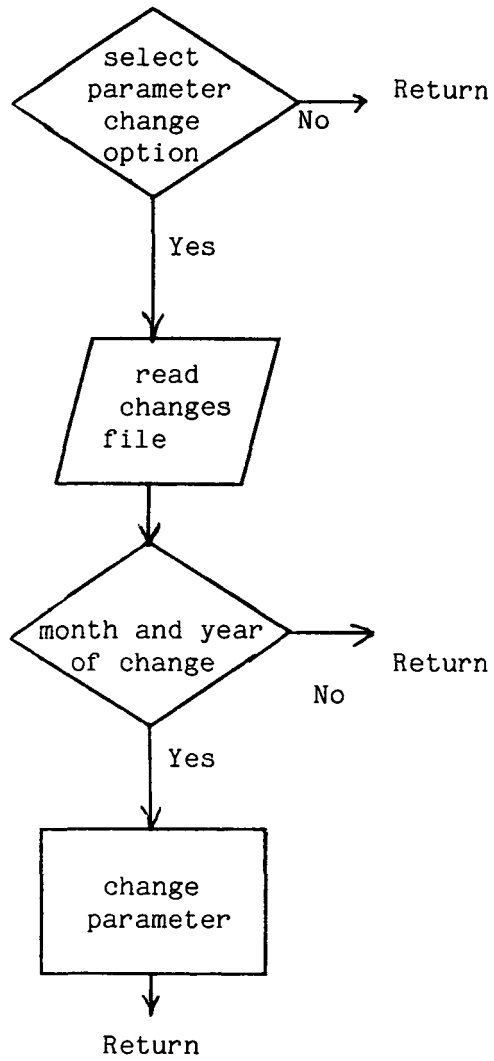

Figure 5. Diagram of parameter changes.

Table 3. Input/Output Files

Unit Number	File Name	Description	Max Record Length
1	IAQ	Aquifer parameter data	80 characters
2	ICH	Change parameter data	80
3	IDA	Simulation specification	80
4	IH	heads from a previous simul.	80
5	IPA	alternative pumpage data	80
6	IPF	fixed pumpage data	80
7	IPY	yearly pumpage data	80
8	IRA	precipitation data	80
9	IRI	Miss. River stage data	80
10	ISP	Miss. R. slope profiles	80
11	OC	heads for a time step	80
12	OFP	alternative pumpage	80
15	OG	heads for a cell location	87
16	OH	heads at final time step	80
17	OHM	maximum yearly heads	80
18	OR	output results	132
19	OS	output summary	132

Table 4. Subroutines Used in Program

Subroutine Name	Description
HYDROG	Writes heads at a location in a file
PUMPAGE	Determines pumpage at a time
FINDP	Determines pumpage to meet a target ele.
RCHARGE	Calculates recharge according to precip.
HRW	Reads initial heads or writes final heads
RSTAGE	Calculates river stages at specified cells
OWRITE	Writes output
CONTOUR	Writes heads at a time step
MASS	Calculates a mass balance
TRNSFR	Changes parameters
SWITCH	Used by TRNSFR to switch values changed
MAXH	Determines maximum head in a year

Figure 6. Example of a command file used for execution of the computer model.

Because of the size of some of the output files, particularly OMH and OR, it is suggested that if simulations exceeding 120 time steps (10 years) are planned magnetic tape may be desired. Both the size of OHM and OR are dependent on options in addition to the number of time steps. See section 6 of this document for information on what is written to these files. If magnetic tape is to be used, it can be done without modification of the program code: consult your computer system documentation.

5.0 DATA FILE PREPARATION

The American Bottoms groundwater flow model requires data that describe the hydrologic conditions (i.e., aquifer properties, historical pumpage, precipitation, and Mississippi River stage), and data that describe the simulation that is desired (e.g., the starting month and year and the number of months to be simulated). This section of the report describes the organization of data required to make a simulation. Figure 2 of Part B presents the model grid, and the locations of boundary conditions. The values of aquifer properties and boundary conditions are presented in the complete data listing (Attachment II).

Input data are organized into data files and are separated by data topic. The model requires ten data files as input and are described in alphabetical order by data name. The line number on which data is located and the FORTRAN format is also presented. Section 7, which describes three sample problems, should be referred to because it includes a listing of data input for actual simulations. Also, a complete program listing (see Attachment I) and a glossary of variable and constant names (see Attachment II) is included for reference.

The file named IAQ (Input, AQuifer data) contains aquifer information for each grid cell. The computer program variables that represent this data are presented in table 5.

All of the aquifer parameters for a given node are specified on one line of the data file. This file has approximately 750 lines of data. This is a reduced number from the number of nodes in the model. The program code is written so that cells not specified are given values appropriate for the bluff. This reduces the number of lines of data by a considerable amount.

Most of the variables in file IAQ are described in ISWS Bulletin 55; the suffix [TEM] can be removed to find the variable name. Those variables not described in Bulletin 55 are; [AOI], [AI], [RIMMTEM], and [CFTEM]. The character variable [AOI] is used to identify grid cells within the area of interest and which require certain special output. By inserting an asterisk (*), a cell is identified as part of an area of interest. The character variable [AI] identifies the column location of the cell. This modification was required for compatibility with notation used by the Corps of Engineers. The character variable [AI] is internally converted into an integer number [I], consistent with notation used in Bulletin 55. The real variable [RIMMTEM] specifies the position of the cell on the Mississippi River. This is a real number that is either positive from 167.2 to 206.5 identifying the mile mark above the confluence of the Mississippi and Ohio Rivers, or it is zero (0.0) indicating that the cell does not represent a river node. The variable [CFTEM] specifies constant flux cells. This boundary value was treated in Bulletin 55 as a negative constant withdrawal term [Q].

The file named ICH (Input, CHange) is for defining cells which require parameter changes during simulation. Table 6 lists the variable names specified in file ICH.

Table 5. Input Data in File IAQ

LINE	VARIABLE NAME	VARIABLE DESCRIPTION	FORTRAN FORMAT
1	AOI	flag for cell in area of interest	A1
	AI	column character for model	A2
	J	row number for model	I3
	TTEM	aquifer transmissivity (gpd/ft)	F6.0

			F4.0

Aquifer parameters that make up the array CHDATA are input in the same units as those in the aquifer parameter file IAQ and as those described in Bulletin 55. The character variable [CHCMMNT] is an 80 character title for each set of changes. The title will appear in the summary file OS (see section 6). The program is capable of handling nests of changes as well as sequentially.

File IDA (Input, DATA) contains information that defines simulations. This includes parameters that control the simulation and options that give flexibility to the modeler concerning special program capabilities and output. Input data files were structured so that file IDA is the only file requiring set-up or changes to run most simulations. Input variables are listed in table 7.

Specifications which must be made in IDA include: beginning month of simulation [IBEGMO], beginning year of simulation [IBEGYR], number of time steps in the simulation [NSTEPS] and permissible error [ERROR]. Options, which are selected by a "T" for true and omitted by a "F" for false, may be specified as desired. They include: specifying a target elevation (depth above or below land surface) that is referenced in output [TARG], selection of variable river stage or constant river stage [LRIVO], selection of variable recharge or constant recharge [LRECO], saving head values at the final time step [LWHFO], recalling head values from a prior simulation [LRH00], selection of standard pumpage input, specifying use of annual pumpage data [LPUYO], constant pumpage data [LPUFO], and/or alternative pumpage data [LPUAO], selection of six different outputs; category printout of aquifer parameters [LCAIO], heads to four decimal places printed [LTHSO], category printout of heads [LCA00], and decimal printout of depth to water from land surface [LHTNO], specifying heads be written to a file for up to fourteen

cells [LGRAO], specifying mass balance calculation [LMASO], specifying heads be written to a file at up to fourteen times [LCONO], specifying certain aquifer parameters may be changed for a specified period [LTRAO], specifying determination of maximum heads for a calendar year and writing the heads to a file [LMAHO].

Selecting one of these options mandates either inclusion of a specified data or generation of specified output. Table 8 shows options and the files that contain the data they require.

The file IH (Input, Head) contains the groundwater level in each cell at a time specified by a previous simulation (see table 9). The file consists of a one line title which identifies the year in which the final heads were written. This is followed by three lines with seven water levels and one line with eight water levels for each row of the grid. This same format is also used in output files OC, OH and OHM.

The file IPA (Input, Pumpage, Alternative) contains the pumpage data for alternative pumpage projects (see table 10). The first line of the file is written to the summary output (OS) and the second line serves to guide the user to the position of data. Pumpage data for nodes are contained on two lines. Each line contains data for 15 years. This file has the same format as the output file OFP.

The file IPF (Input, Pumpage, Fixed) contains the pumpage data for simulations where pumpage is held constant for the entire period simulated (see table 11). The first line of the file is written to the summary output (OS); the second line specifies the first year of pumpage data [IBPYEAR], the number of years of pumpage data [NYRPUMP] and the number of pumps [NP]; and the third line serves to guide the user to the position of data. Pumpage data for each node are contained on one line.

Table 8. Files Required with Each Option Selected

OPTION NAME	DESCRIPTION (IF CALLED)	FILES USED (IF CALLED)
LRIVO	computes river stage at each time step	IRI, ISP and OS
LRECO	computes recharge and evapotranspiration at each time step	IRA and OS
LTRAO	changes hydrologic conditions at specified times	ICH and OS
LMAHO	computes maximum heads for the grid each year	OHM and OS
LRHOO	reads heads (initial) from a previous simulation	IH and OS
LWHFO	writes heads at final time step	OH and OS
LPUYO	reads yearly pumpage data	IPY and OS
LPUFO	reads fixed pumpage data	IPF and OS
LPUAO	reads alternative pumpage data	IPA and OS
LCAIO	writes category output of input	OR and OS
LCAOO	writes category output of heads	OR and OS
LTHSO	writes numerical output of heads	OR and OS
LGRAO	writes heads at each time step	IDA, OG and OS
LCONO	writes heads at specified time steps	IDA, OC and OS
LMASO	computes water mass balance	OR and OS
LFPUO	estimates and writes pump sizes to meet target elevation	OFF and OS

Table 13. Input Data for File IRA

LINE	VARIABLE NAME	VARIABLE DESCRIPTION	FORTRAN FORMAT
1	HEADING	title	A80
2+	IYEAR	year of precipitation data	I4
	P	total monthly precipitation	2 lines 6F6.2

The values of [IBPYEAR] and [NYRPUMP] may not seem necessary; however, they are required. This was done to keep the input data consistent with the yearly pumpage data in file IPY.

The file IPY (Input, Pumpage, Yearly) contains the pumpage data for simulations where pumpage is changed according to the year being simulated (see table 12). As in the file IPF the first line of the file is written to the summary output (OS); the second line specifies the first year of pumpage data, the number of years of pumpage data and the number of pumps; and the third line serves to guide the user to the position of data. Pumpage data for each node are contained on six lines with ten years of pumpage on each line.

The file IRA (Input, RAin) contains precipitation data for the St. Louis airport weather station at Lambert Field. The file has a one line title (see table 13) to identify the file contents and to be written to the summary output file (OS). Precipitation data consist of two lines per year. The first line has the year [IYEAR] followed by monthly total precipitation data, in inches, for the months January through June. The second line reiterates the year followed by data for the months July through December.

Data must be continuous and successive. It may begin at any year including, or prior to, the first year of simulation; however, each pair of lines must be the data for the year.

The file IRI (Input, River stage) contains data for the Mississippi River stage at the St. Louis gage. As with the precipitation file IRA, this file also has a one line title (see table 14) to identify the contents of the file and to be written to the summary output file (OS). River stage data consist of two lines per year. The first line has the year [IYEAR] followed by monthly average river stage data, in feet above mean sea level, for the

Table 14. Input Data for File IRI

Table 15. Input Data for File ISP

LINE	VARIABLE NAME	VARIABLE DESCRIPTION	FORTRAN FORMAT
1	HEADING	title	A80
2+	SMAT	slope profile matrix data	16 lines F5.1, 9F5.2, F5.1

months January through June. The second line contains the year and data for the months July through December.

Again as with precipitation data, the river stage data may begin with any year, but the next year's data must be the next year chronologically.

The file ISP (Input, Slope, Profile) contains a matrix form of Mississippi River slope profiles from Alton, IL, to Jefferson Barracks, MO. The file contains a one line title (see table 15) and 16 lines of data that make up the matrix. The first line of data is Mississippi River mile marks, in miles above the confluence of the Ohio and Mississippi Rivers. The following 15 lines of data contain river stages at mile marks that correspond to the St. Louis gage.

6.0 FILES GENERATED BY THE FLOW CODE

The American Bottoms groundwater flow model produces output for interpretation and for further processing. Output is organized according to topic, e.g. all output generated for hydrographs or for contours is directed to separate files. The FORTRAN format of output is presented. Reference to the sample problems, FORTRAN program listing and glossary for variables (see Attachment I) will aid in understanding program output. Of the nine files that accept output, only file OR has printer character control characters imbedded in the file.

The file OC (Output, Contour) is the repository for heads generated at various specified months and years in file IDA. Up to 14 sets of head values for the entire model may be placed in the file. Each set of head values includes a one line title that provides the month and year of the heads (see table 16). If the option to write heads to OC is not specified in line 4 of IDA [LCONO] or the months and years simulated do not correspond to those

Table 16. Variables Specified to Output to File OC

LINE	VARIABLE NAME	VARIABLE DESCRIPTION	FORTRAN FORMAT
1	HEADA	title card	A25
	MON	current month	A10
	NYR	current year	I4

1	TITLE	title	A40
	TARGET	target elevation for pump sizes	F5.1
3	AI	column location	A2
	J	row location	I2
	DW	pump size in mgd	A1

specified in line 6 of IDA [IMO and IYR] no output will be written to this file.

The file OFP (Output, Find Pumpage) is the repository for pumpage data for alternative pumping schemes to meet the specified target elevation. The file contains a one line title (see table 17) that indicates the target depth from land surface, a one line dummy that sets apart columns of output (a format written statement) and two lines of pump information for each specified node. Specified nodes are those designated as in the area of interest and marked with an asterisk in column 1 of the aquifer data file (IAQ). The format of the pump information is the same as for the input file IPA described previously.

The file OG (Output, hydroGraph) is the repository for heads generated at specified locations for the entire simulated time period. The option to generate this output and the cells for which output is generated are specified in file IDA. Up to 14 locations may be specified for head values. The file contains a one line title, a one line list of node locations for which heads, in columnar form, are listed and a one line list of land surface elevations (msl) for each of the cells (see table 18). This is followed by the month and year and the water levels for each of the specified nodes.

The file OH (Output, Heads) is the repository for heads generated at the final time step [NSTEP] of the simulation. These values may be recalled for use as initial heads [HO] by merely changing the name of the file from OH to IH (see table 19).

The file OHM (Output, Heads, Maximum) is the repository for the maximum water level for each year simulated at every node. This file consists of a one line title and four lines of maximum heads for each node. The format of

Table 18. Variables Specified to Output to File OG

Table 20. Variables Specified to Output to File OHM

LINE	VARIABLE NAME	VARIABLE DESCRIPTION	FORTRAN FORMAT
1	HEADING	title	A80
2+	HMAX	maximum heads	F7.1

the output is the same as for the other input and output of this type of information. This includes information in files IH, OC, and OH.

The maximum values are calculated at the end of each time step and are written at the end of each calendar year. Note that a simulation beginning in December would consider those heads as the maximum for the year.

The file OR (Output, Results) is the repository of most of the details of each simulation. This includes general information, such as the current month and year, the number of iterations for an acceptable solution, and the error criterion, and it includes specific information, such as the mass balance, category output of input data and the calculated heads at each node. This information is too lengthy to present in tabular form so the reader should refer to output from the sample problems.

The file OS (Output, Summary) is the repository of limited information to quickly identify simulation parameters and options. It includes identifying statements as to when the simulation was initiated, what options were called, and if the intended information was accessed. Table 21 presents a portion of the file output.

7.0 SAMPLE PROBLEMS

Three sample problems are presented to illustrate the types of simulations that were conducted with the model and to serve as examples to setting up and running the model. Because of the large number of input and output files, many of which are similar for the three problems, only selected files are included.

SAMPLE PROBLEM ONE

Sample problem one illustrates the capability to simulate groundwater levels with forecast pumpage for the year 2000.

Figure 7 is a listing of file S1FC (Sample 1, Flow program, Command file). The command file is specific to the type of computer system on which the program is run.

Figure 8 is a listing of file S1ID (Sample 1, Input, Data) which contains specifications for the simulation. In this example, the simulation is for 60 time steps beginning in January of 1971.

Figure 9 is a listing of file S1OS (Sample 1, Output, Summary). The first 15 lines includes the program title, data and time of the simulation, specifications from file S1ID, and titles from input files used in the program. The remainder of the file summarizes each time step.

Figure 10 is a listing of file S10C (Sample 1, Output, Contour). This file contains water levels for all cells in the model at time step 11 and corresponds to November, 1971. This was specified in S1 ID on the line containing specifications (line 4) and on the line containing months and years (line 6). This can be noted in the file S10S.

Figure 11 is a listing of file S10G (Sample 1, Output, Graph). This file contains water levels for specified cells at every time step. This was specified in line 4 of the file S1ID. Specification of cells for which water levels are written is on line 6 of file S1ID.

Figure 12 is a listing of file S10R (Sample 2, Output, Result). This file contains output as specified in file S1ID. In this case, category printout of input aquifer parameters and water levels at each time step, as depth to water from the land surface, are written to this file.

SAMPLE PROBLEM TWO

Sample problem two illustrates the capability to simulate groundwater levels with forecast pumpage for the year 2000 and alternative pumpage to achieve the target depth of 8 feet below land surface elevation.

Figure 12. Concluded

Figure 13 is a listing of file S2FC. Differences between this command file and that for example one include: use of a different initial head file, IH70 (Input, Heads, 1970) was used in example one whereas IH0870 (Input, Heads, target level of 8 feet, 1970) was used in example two; inclusion of alternative pumpage as part of the fixed pumpage data, IPF200R (Input, Pumpage, Fixed, year 2000, Reduced grid) in example one and S2IPF (Sample 2, Input, Pumpage, Fixed) in example two; and additional files saved in example two.

Figure 14 is a listing of file S2ID. Line 4 includes specification of the target level of 8.0 feet and the "find pump" option as true.

Figure 15 is a listing of file S2IPF. Pumpage data includes forecast pumpage for the year 2000 followed by alternative pumpage.

Figure 16 is a listing of file S20S. Options called are identified as is files read. The final line indicates that 394 records were written to the OFP (Output, Find, Pumps) file. This number corresponds to the number of cells in the area of interest.

Figure 17 is a listing of file S20FP (Sample 2, Output, Find, Pumps). This file lists cells within the area of interest and has integer values of pumpage required (in addition to that specified in file S2IPF) to meet the specified target elevation. To reduce space only cells which were determined to require additional pumpage were listed.

Figure 18 is a listing of file S20G.

Figure 19 is a listing of file S20MH (Sample 2, Output, Maximum Heads). Output placed in this file has the same format as other output of heads at all cells, such as OC and OH. This file, however, contains the maximum heads value for the entire year listed in the heading. Here, only the output for

Figure 19. Concluded

1971 is included, whereas in an actual simulation output for 1971, 1972, 1973, 1974 and 1975 would be present.

SAMPLE PROBLEM THREE

Sample problem three illustrates the capability to simulate groundwater levels with forecast pumpage for the year 2000 and alternative gravity collectors to achieve the target depth of 8 feet below land surface elevation.

Figure 20 is a listing of file S3FC. The difference between this command file and that for example two is substitution of IPF200R for S2IPF and S3IGA (Sample 3, Input, Gravity collector, Aquifer parameters) for IAQR (Input, Aquifer parameters, Reduced grid).

Figure 21 is a listing of file S3ID.

Figure 22 is a listing of file S3IGA. This file contains the aquifer parameter data for the entire model, as well as additional aquifer parameter data which specify the gravity collectors. Cells that represent gravity collectors duplicate some aquifer parameters. This is for simplification during testing of the collectors. For example, aquifer parameters for cell D 10 is located in two places in the listing. The first is the aquifer parameters for the "historical" model. The second is the aquifer parameters for the gravity collector. It should be noted that cells representing gravity collectors are not specified as in the area of interest. This is necessary when using the "find pump" option to prevent the program from always determining gravity collectors as exceeding the target elevation.

Figure 23 is a listing of file S30S.

Figure 24 is a listing of file S30G.

ATTACHMENT I. DIRECTORY AND EXPLANATION OF FILES

**List and description of files produced by the
American Bottoms Groundwater Flow Model.**

DAY dayfile
DAYSAVE dayfile produced by a read from magnetic tape
DAYSIM dayfile produced by flow model command file
FFOO FORTRAN V compiled version of the flow model
FF25 FORTRAN V compiled version of the "pump find" model
FLOWOO source code of the flow model
FLOW25 source code of the "pump find" version
IAQR aquifer parameter (reduced grid) input file
ICHR change parameter (reduced grid) input file
IDOG input for gravity collector alt. (no pumpage)
IDOP input for pumpage alt. (no pumpage)
ID2G input for gravity collector alt. (year 2000 pumpage)
ID2P input for pumpage alt. (year 2000 pumpage)
IH0350 initial heads for 12-1950 (adj. for 3 ft target)
IH0850 initial heads for 12-1950 (adj. for 8 ft target)
IH0870 initial heads for 12-1970 (adj. for 8 ft target)
IH1450 initial heads for 12-1950 (adj. for 14 ft target)
IH1450T initial heads with IDOT location at specified head
IH70 initial heads for 12-1970
INITH source code of program to adjust initial heads
INITHF FORTRAN V compiled version of INITH
IPATOT source code to determine no. of pumping periods
IPATOTF FORTRAN V compiled version of IPATOT
IPAO dummy file of alternative pumpage data
IPFOOR input for no pumpage condition (reduced grid)
IPFOOT input as IPFOOR without IDOT
IPF199R input for year 1990 pumpage condition (reduced grid)
IPF200R input for year 2000 pumpage condition (reduced grid)
IPF200T input as IPF200T without IDOT
IPYR input of annual pumpage (reduced grid)
IRA input of precipitation data
IRI input of Mississippi River stage data
ISP input of Mississippi River slope profiles
PUMP15 source code to analyze "pump find" data (5 years)
PUMP15F FORTRAN V compiled version of PUMP15
PUMP90 source code to analyze "pump find" data (30 years)
PUMP90F FORTRAN V compiled version of PUMP90
SSETFC command file for sample problem setup
SSETID input data for sample problem setup
SSETOG output graphical data from setup of sample problem
SOFC command file for sample problem 0
SO ID input data for sample problem 0
S1 FC command file for sample problem 1
S1 ID input data for sample problem 1
S1 OC output contour data from sample problem 1
S1 OG output graphical data from sample problem 1

S1OR output results from sample problem 1
S1OS output summary from sample problem 1
S2FC command file for sample problem 2
S2ID input data for sample problem 2
S2IPF input pumpage data for sample problem 2
S2OC output contour data from sample problem 2
S2OFP output "find pump" data from sample problem 2
S2OG output graphical data from sample problem 2
S2OMH output maximum heads from sample problem 2
S2OR output results from sample problem 2
S2OS output summary from sample problem 2
S3FC command file for sample problem 3
S3IAQR input aquifer parameter data sample problem 3
S3ID input data for sample problem 3
S3IGA input gravity collector data for sample problem 3
S3OC output contour data from sample problem 3
S3OG output graphical data from sample problem 3
S3OR output results from sample problem 3
S3OS output summary from sample problem 3
TAPEAM command file to read a magnetic tape
TAPEAMF command file to read a magnetic tape
TAPEDOC command file documenting read of magnetic tape
TAPEIN command file for magnetic tape
TAPERUN command file for magnetic tape
TAPEWB1 command file for magnetic tape
TEXAMIN command file for magnetic tape
TGG322 test output of graphical data for gravity coll. alt.
TPC321 test output of contour data for pumpage alt.
WI input data for water level exceedance program (WLEX)
WLEX source code for water level exceedance program
WLEXF FORTRAN V compiled version of WLEX
XCEED original source code for WLEX (includes NCAR graphics)

3 ft target, no future pumpage, system one, gravity collector alternative

101GC output: contour
101GMH output: maximum heads
101GS output: summary
101IGA input: aquifer parameters/gravity collectors

3 ft target, no future pumpage, system one, pumpage alternative

101IPA input: alternative pumpage
101PC output: contour
101PG output: graph
101PMH output: maximum heads
101PR output: results
101PS output: summary

3 ft target, no future pumpage, system two, pumpage alternative

102IPF input: alternative pumpage
102PC output: contour
102PDAY output: dayfile

102PG output: graph
 102PMH output: maximum heads
 102POP output: pumpage residual (PUMP90)
 102POX output: water level exceedance (WLEX)
 102PPF output: pump residual data for PUMP90
 102PR output: results
 102PS output: summary

3 ft target, year 2000 pumpage, system one, gravity
 collector alternative

121GC output: contour
 121GDAY output: dayfile
 121GG output: graph
 121GMH output: maximum heads
 121GOP output: pumpage residual (PUMP90)
 121GOX output: water level exceedance (WLEX)
 121GPF output: pump residual data for PUMP90
 121GR output: results
 121GS output: summary
 121IGA input: aquifer parameters/gravity collectors

3 ft target, year 2000 pumpage, system one, pumpage
 alternative

121IPA input: alternative pumpage
 121PC output: contour
 121PDAY output: dayfile
 121PG output: graph
 121PMH output: maximum heads
 121POP output: pumpage residual (PUMP90)
 121PPF output: pump residual data for PUMP90
 121PR output: results
 121PS output: summary

3 ft target, year 2000 pumpage, system two, pumpage
 alternative

122IPF input: alternative pumpage
 122PC output: contour
 122PG output: graph
 122PMH output: maximum heads
 122PR output: results
 122PS output: summary

8 ft target, no future pumpage, system one, gravity
 collector alternative

201GC output: contour
 201GG output: graph
 201GMH output: maximum heads
 201GS output: summary
 201IGA input: aquifer parameters/gravity collectors

8 ft target, no future pumpage, system one, pumpage
 alternative

200APF input: alternative pumpage (duplicate of 201IPA)
 201IPA input: alternative pumpage

201PC	output: contour
201PDAY	output: dayfile
201PG	output: graph
201PMH	output: maximum heads
201POP	output: pumpage residual (PUMP90)
201POX	output: water level exceedance (WLEX)
201PPF	output: pump residual data for PUMP90
201PR	output: results
201PS	output: summary
8 ft target, no future pumpage, system two, pumpage alternative	
202IPF	input: alternative pumpage
202PC	output: contour
202PDAY	output: dayfile
202PG	output: graph
202PMH	output: maximum heads
202POP	output: pumpage residual (PUMP90)
202POX	output: water level exceedance (WLEX)
202PPF	output: pump residual data for PUMP90
202PR	output: results
202PS	output: summary
8 ft target, year 2000 pumpage, system one, gravity collector alternative	
221GC	output: contour
221GG	output: graph
221GMH	output: maximum heads
221GR	output: results
221GS	output: summary
221IGA	input: aquifer parameters/gravity collectors
8 ft target, year 2000 pumpage, system one, pumpage alternative	
221IPA	input: alternative pumpage
221PC	output: contour
221PG	output: graph
221PMH	output: maximum heads
221PR	output: results
221PS	output: summary
8 ft target, year 2000 pumpage, system two, pumpage alternative	
222IPF	input: alternative pumpage
222PC	output: contour
222PDAY	output: dayfile
222PG	output: graph
222PMH	output: maximum heads
222POP	output: pumpage residual (PUMP90)
222POX	output: water level exceedance (WLEX)
222PPF	output: pump residual data for PUMP90
222PR	output: results
222PS	output: summary

14 ft target, no future pumpage, system one, gravity collector alternative

301GG output: graph
301GMH output: maximum heads
301GR output: results
301GS output: summary
301IGA input: aquifer parameters/gravity collectors

14 ft target, no future pumpage, system one, pumpage alternative

301IPA input: alternative pumpage
301PC output: contour
301PG output: graph
301PMH output: maximum heads
301PR output: results
301PS output: summary

14 ft target, no future pumpage, system two, gravity collector alternative

302GC output: contour
302GDAY output: dayfile
302GG output: graph
302GMH output: maximum heads
302GOP output: pumpage residual (PUMP90)
302GOX output: water level exceedance (WLEX)
302GPF output: pump residual data for PUMP90
302GR output: results
302GS output: summary
302IGA input: aquifer parameters/gravity collectors

14 ft target, no future pumpage, system two, pumpage alternative

302IPF input: alternative pumpage
302PC output: contour
302PDAY output: dayfile
302PG output: graph
302PMH output: maximum heads
302POP output: pumpage residual (PUMP90)
302POX output: water level exceedance (WLEX)
302PPF output: pump residual data for PUMP90
302PR output: results
302PS output: summary

14 ft target, year 2000 pumpage, system one, gravity collector alternative

321GC output: contour
321GG output: graph
321GMH output: maximum heads
321GR output: results
321GS output: summary
321 IGA input: aquifer parameters/gravity collectors

14 ft target, year 2000 pumpage, system one, pumpage
alternative

320BPG output: graph of preliminary simulation
321IPA input: alternative pumpage
321PC output: contour
321PDAY output: dayfile
321PG output: graph
321PMH output: maximum heads
321POP output: pumpage residual (PUMP90)
321POX output: water level exceedance (WLEX)
321PPF output: pump residual data for PUMP90
321PR output: results
321PS output: summary

3 ft target, no future pumpage, system one, gravity
collector alternative

322GC output: contour
322GDAY output: dayfile
322GG output: graph
322GMH output: maximum heads
322GOP output: pumpage residual (PUMP90)
322GOX output: water level exceedance (WLEX)
322GPF output: pump residual data for PUMP90
322GR output: results
322GS output: summary
322IGA input: aquifer parameters/gravity collectors

14 ft target, year 2000 pumpage, system two, pumpage
alternative

322IPF input: alternative pumpage
322PC output: contour
322PG output: graph
322PMH output: maximum heads
322PR output: results

ATTACHMENT IV. DEFINITION OF PROGRAM VARIABLES

Variable map of main program.

AA	coefficient in water balance equations
AC	model column letter
AOI	test cell location in the area of interest
AOITEM	temporary value of AOI
ARRAY	underflow trap
B	Peaceman-Rachford B array-
BB	coefficient in water balance equations
BOT	elevation of bottom of the aquifer (ft)
BOTTEM	temporary value of BOT
CC	coefficient in water balance equations
CFLUX	specified flux (gpd)
CFLUXTI	total specified flux inflow
CFLUXTO	total specified flux outflow
CFTEM	temporary value of CFLUX
CH	elevation of top of aquifer (ft)
CHCOMMENT	comment to parameter change data
CHDATA	aquifer parameter change data
CHDT	total flow from specified head boundaries
CHST	total flow to specified head boundaries
CHTEM	temporary value of CH
COMNT1	comment
COMMT2	comment
D	change in head during time increment
DATER	date of model run
DD	coefficient in water balance equations
DEL	time increment
DELTA	time increments (days)
DL	head predictor
DTOT	cumulative volume of water for find pump
DW	find pump size
E	sum of error at each cell
ERROR	error criterion
ESUB	subtotal of error
ETFLXT	evapotranspiration flow total
F	head predictor flag
FAL	false
FLXNT	total negative et flux
FLXPT	total positive et flux
G	Peaceman-Rachford G array
H	heads at end of time increment (ft)
HA	re-estimate of heads
HEADING	heading
HMAX	maximum heads at end of time increment of current year
HO	heads at start of time increment (ft)
HTEM	temporary value of H
I	model column number
IABORT	flag for find pump error

IBEGMO beginning month of simulation
 IBEGYR beginning year of simulation
 ICHANG number of parameter changes specified
 ICRDSUM number of cells in current parameter change
 IDELYR number of years of simulation
 IENDYR ending year of simulation
 IH model column number for input head
 IIAQ unit number of aquifer parameter data input
 IICH unit number of parameter change data input
 IIDA unit number of input data
 IIHO unit number of initial heads data input
 IIPA unit number of alternative pumpage data input
 IIPF unit number of fixed pumpage data input
 IIPY unit number of yearly pumpage data input
 IIRA unit number of precipitation data input
 IIRI unit number of Miss. River stage data input
 IISP unit number of Miss. River slope profile data input
 IMCUR month currently being simulated
 IMO month at which heads are written to contour
 IOCO unit number of heads for contours output
 IOFP unit number of pump size data output
 IOGR unit number of heads for hydrographs output
 IOHF unit number of final heads output
 IOHM unit number of maximum heads output
 IORE unit number of results output
 IOSU unit number of summary output
 IP model column number of pump locations
 IRIERR error flag from river stage calculation
 ISTART flag for beginning of parameter change
 ISTEP current time step
 ISTOP flag for end of parameter change
 ITER current number of iterations
 ITF flag for convergence test
 ITR column number of parameter change
 IYCUR current year
 IYR year at which heads are written to contour
 J model row number
 JH model row number for input head.
 JP model row number of pump locations
 KC pumpage schedule counter
 LCAIO option for category printout of input data
 LCAOO option for category printout of output
 LCONO option for contour output
 LFPUO option for find pump determination
 LGRAO option for graphical data output
 LHTAO option for change parameters
 LHTNO option for heads to the nearest foot
 LMAHO option for maximum heads determination
 LMASO option for mass balance calculation
 LOC location of find pump field
 LPUAO option for alternative pumpage
 LPUFO option for fixed pumpage
 LPUYO option for yearly pumpage
 LRECO option for variable recharge

LRHOO option for reading initial heads
 LRIVO option for variable river stage
 LWHFO option for writing out final heads
 MON months
 N miscellaneous counter
 NC number of columns in model
 NCHANG number of parameter changes
 NP number of pumps
 NR number of rows in model
 NSTEPS number of time increments
 P DIMENSION (13,40)
 PERCNT percent difference between in and out of mass balance
 PERM hydraulic conductivity (gpd/ft²)
 PERMTEM temporary value of PERM
 PRECI precipitation at St. Louis airport (in)
 PUMPT total pumpage (gpd)
 PX magnitude of pumpage at each time increment (gpd)
 Q constant withdrawal rate (gpd)
 QM modified constant withdrawal rate
 QRET total recharge and evapotranspiration
 QTEM temporary value of Q
 R recharge factor (gpd/ft)
 RB flag for evapotranspiration
 RD elevation of bottom of streambed or elevation below
 which evapotranspiration ceases (ft)
 RDTEM temporary value of RD
 RE recharge term in row and column equations
 RH elevation of land or stream surface (ft)
 RHTEM temporary value of RH
 RIMM Mississippi River mile mark at cell (i,j)
 RIMMTEM temporary value of
 RIVER Mississippi River stages at St. Louis gage
 RM modified recharge factor
 RTEM temporary value of R
 S storage factor at current cell
 SF1 storage factor for artesian conditions (gal/ft)
 SF1TEM temporary value of SF1
 SF2 storage factor for water table conditions (gal/ft)
 SF2TEM temporary value of SF2
 SMAT Mississippi River slope profile matrix
 STORMT total minus change in storage
 STORPT total positive change in storage
 T aquifer transmissivity (gpd/ft)
 TARG depth of target below land surface
 TIMER clock time at which simulation was run
 TIME1 current time of simulation (days)
 TITLE1 title 1
 TITLE2 title 2
 TITLE3 title 3
 TRU true
 TTEM temporary value of T
 W term in water balance equation
 WELL total pumpage from cell (i,j)

Variable map for subroutine HYDROG.

ACIH column letter of cell locations for graph
HEADING heading
HRH land surface elevation
HYD head at ACIH, JH
I model column number
IYEAR current year
J model row number
K counter

Variable map for subroutine PUMPAGE.

ACIP column letter of pump location
DUMMY dummy
HEADING heading
I model column number
IBPYEAR beginning year of pumpage data
IIPU unit number of pumpage file
IPUMP NOT USED
IYEAR current year
IYLOC location of year in alternative pumpage file
J model row number
K counter for number of pumps
KK counter for number of years of pumpage
L counter for number of cells in the area of interest
LX counter for number of alternative pumping periods
M counter for number of years of pumpage
MOAJT adjustment for month of alternative pumping period
MN counter for number of years of pumpage
NYRPUMP number of years of pumpage
PUM pumpage (million gpd)
PUMCNST fixed pumpage (million gpd)
TITLE title

Variable map for subroutine FINDP.

AI model column letter
DDT1 volume in storage under artesian conditions
DDT2 volume in storage under water table conditions
DTW depth to water from land surface elevation (ft)
I model column number
IABORT flag for pump find out of range
IYLOC location of year in alternative pumpage file
J model row number
L counter for number of cells in the area of interest

LX	counter for number of alternative pumping periods
MOAJT	adjustment for month of alternative pumping period
NPSIZE	nearest integer of PSIZE
PSIZE	calculated pump size in mgd
PUM	pumpage (million gpd)
RDTW	depth to water from elevation where evapotranspiration ceases
TDTW	depth to water from land surface
TITLE	title
TITLE2	title

Variable map for subroutine RCHARGE.

AMPT	average monthly total precipitation
AMRT	average monthly Mississippi River water temperature
AYRT	average yearly Mississippi River water temperature
ETR	evapotranspiration factor
HEADING	heading
I	model column number
IYEAR	current year
J	model row number
L	counter for month of year
M	counter for year of record
N	counter for record number in data file
NM	counter for month of year
P	precipitation data
PVAL	temporary value of P
WR	potential recharge factor

Variable map for subroutine HRW.

HEADIN	input heading
HEADOUT	output heading
I	model column number
J	model row number

Variable map for subroutine RSTAGE.

HEADING	heading
I	model column number
II	counter for location in slope profile matrix
IYEAR	current year
J	model row number
JJ	counter for location in slope profile matrix
L	counter for month of year
M	counter for year of record

N counter for record number in data file
 NM counter for month of year
 S river stage
 STGH1 first river stage high value
 STGH2 second river stage high value
 STGL1 first river stage low value
 STGL2 second river stage low value
 STG1 interpolated river stage

Variable map for subroutine OWRITE.

ADTW character value of depth to water from land surface
 AOI flag for area of interest
 ETOT total error
 I model column number
 IB absolute value of depth to water
 IDTW integer value of depth to water (ft)
 I1 ones unit value of depth to water
 I10 tens unit value of depth to water
 I100 hundreds unit value of depth to water
 J model row number
 K counter for number of tab
 K1 counter for left category printout
 K2 counter for right category printout
 L counter for depth to water printout
 MAPI left category printout map
 MAP2 right category printout map
 NT number of tabs of category printout for general maps
 NT2 number of tabs of category printout for map two
 NT3 number of tabs of category printout for map three
 NT4 number of tabs of category printout for map four
 NT5 number of tabs of category printout for map five
 NT6 number of tabs of category printout for map six
 NT7 number of tabs of category printout for map seven
 NT8 number of tabs of category printout for map eight
 O1 value of ones place of depth to water
 O10 value of tens place of depth to water
 O100 value of hundreds place of depth to water
 R1 character value for left category printout
 R2 character value for right category printout
 TAB1 tab character for general maps
 TAB2 tab value for general maps
 TAB21 tab character for map two
 TAB22 tab value for map two
 TAB31 tab character for map three
 TAB32 tab value for map three
 TAB41 tab character for map four
 TAB42 tab value for map four
 TAB51 tab character for map five
 TAB52 tab value for map five
 TAB61 tab character for map six

TAB62 tab value for map six
TAB71 tab character for map seven
TAB72 tab value for map seven
TAB81 tab character for map eight
TAB82 tab value for map eight

Variable map for function IND.

AC model column letter
A1 model column first letter
A2 model column second letter
I model column number
IND number value of model column letter

Variable map for function DNI.

AC model column letter
A1 model column first letter
A2 model column second letter
DNI letter value of the model column number
I model column number

Variable map for subroutine CONTOUR.

HEADA heading A
HEADB heading B
I model column number
J model row number
N counter for number of contour specification
NYR number of year for contour

Variable map for subroutine MASS.

J model row number
PUMP total pumpage at cell
QREFLX total Q (constant withdrawal rate) at cell
RB flag for evapotranspiration
RE value of recharge
RFLUX total recharge flux
S storage factor for appropriate condition
STOR sum of the change in storage
STORI change in storage over time increment

STORM	minus change in storage
STORP	plus change in storage
SUMR	sum of water balance
TOTL1	total in
TOTL2	total out
X	temporary value
XX	temporary value

Variable map for subroutine TRNSFR.

ACIDTEM	temporary column character of change parameter
CMMT	comment written to summary file
I	model column number
ICARD	counter of cells to be changed
ICBMO	beginning month of change
ICBYR	beginning year of change
ICEMO	ending month of change
ICEYR	ending year of change
ICHANG	counter of current change
IDUMMY	dummy
ISTP	year and month at which change stops
J	model row number
K	counter
LOCATE	location of change parameter cards
NCARDS	number of cell to be changed

Variable map for subroutine SWITCH.

TEMP	value
VAR1	variable one
VAR2	variable two
