Sandra K. Howard
Cheri A. Chenoweth
John P. Lardner

Prepared for
Division of Water Resources
Illinois Department of Transportation
and
Federal Emergency Management Agency

February 1985
These maps and listings of Repository contents are current through September 30, 1984.

**MAP CODES:**

- FHB: Flood Hazard Boundary Map
- FIR: Flood Insurance Rate Map
- FPAM: Flood Prone Area Map

**REPOSITORY CODES:**

- **Study Type:**
  - FIS: Flood Insurance Study
  - REG: Regulatory Study
  - REC: Reconnaissance Study
  - SPS: Strategic Planning Study
  - PPS: Project Planning Study
  - FEA: Feasibility Study
  - FHA: Flood Hazard Analysis
  - FMP: Flood Water Management Plans
  - WMP: Watershed Work Plans
  - FCS: Flood Control Study
  - FPI: Flood Plain Information Study
  - DSR: Dam Safety Report

- **Study Method:**
  - WSP2: Soil Conservation Services Backwater Model
  - HEC2: Corps of Engineers Backwater Model
  - EA31: United States Geological Survey Back Water Model
  - JS35: United States Geological Survey Back Water Model
  - SSC: Standard Step Calculations
  - DSC: Direct Step Calculations
  - HWM: Gage Analysis/High Water Marks/Flood of Record
  - PRM: Physical River Model

- **Author:**
  - DOWR: Division of Water Resources
  - SWS: State Water Survey
  - USGS: United States Geological Survey
  - SCS: Soil Conservation Service
  - CCOE: Chicago Corp of Engineers
  - RCOE: Rock Island Corps of Engineers
  - LCOE: Louisville Corps of Engineers
  - SCOE: St. Louis Corps of Engineers
  - MCOE: Memphis Corps of Engineers

</table>
INTRODUCTION

The federal government has identified approximately 20,000 communities in the United States as having flood hazards. Of these communities, more than 850 are located in Illinois. Continuing efforts at the local, State, and federal levels to reduce flood hazards have been effective in slowing the rate of increase in flood damages, but the total amount of losses continues to grow. Illinois' share of average annual flood damage is over $250 million.

Since the creation of the Governor's Task Force on Flood Control in 1973, the State of Illinois has been very active in promoting and guiding non-structural Solutions as a way of mitigating these flood damage losses. The Task Force's 1975 report presented a detailed assessment of the state's flood-related programs. In a section on the State of Illinois' Flood Damage Prevention Program, this report noted that the Illinois State Water Survey (SWS) had been given responsibility for maintaining a repository of floodplain Information.

The Floodplain Information Repository and other activities related to floodplain Information established by SWS have been described by Lardner et al. (1979) in SWS Circular 137. This circular and a short brochure summarizing the SWS floodplain Information activities have received widespread distribution among public agencies, communities, insurance agents, and Consulting engineers.
A unified, coherent program of floodplain management can be developed and administered at the local level only with the technical support of the many other government entities that are responsible for floodplain management. Flood problems generally occur in communities that lack resources to solve problems and develop programs on their own. Any approach to the flood problem begins with a determination of the extent to which a flood hazard exists. A significant step in this direction is to learn what Information already is available, how appropriate it is for management purposes, and whether better Information should be prepared. The Floodplain Information Repository is a primary resource for this type of Information, not only for local officials but for other public and private establishments as well.

The Illinois Floodplain Information Directory is a source document for all floodplain Information entered in the Repository through September 1984. It is printed in four volumes, each of which covers a portion of the state. Each volume contains listings by county of all studies, reports, maps, or other materials entered in the Repository for the county and its communities. For anyone who needs to know the types, extent, and sources of information available for particular locations in the state, the directory constitutes a useful, current reference.

FLOODPLAIN INFORMATION DIRECTORY FORMAT AND USE

Directory Format

The components of the county entries in the directory are a map of the county, a corresponding Repository listing, and a list of pertinent Flood-Prone Area Maps (FPAMs). The county map includes the following information:

1. County boundary
2. Township boundary indicators
3. County Flood Hazard Boundary Map boundaries, with identifying community-panel numbers

4. Principal streams

5. Locations and names of communities which are featured in Repository information

Communities for which there are no data in the Repository are not plotted. The size of the symbol locating a Community depends on the population; four sizes from smallest to largest represent population ranges of 0-5,000, 5,000-25,000, 25,000-100,000, and more than 100,000. The numbers following a Community name are the report numbers of the Repository items which are concerned with the town. The first number is that of the report considered the best available information for the Community. The remaining reports are grouped by ascending priority level and then ordered numerically. A priority ranking is assigned to a report at the time it is indexed into the Repository, establishing the relative reliability of the information contained in the report. Priority one reports are those which have featured analyses by detailed methods and thorough review of results. If a Flood Hazard Boundary Map (FHBM) exists, then FHB is the last notation made on the map for the Community. The FHBM is not indexed into the Computerized Repository database and has no report number because it does not represent the result of a detailed determination of 100-year flood elevation, but only an estimate of floodplain extent. At the bottom of the map, similar notation is made for reports pertaining to the unincorporated county, with the first number again representing the report with best available information and the last being FHB or the number of the lowest-ranked report. About 50 communities to date have undergone Special Conversion to the regular phase of the National Flood Insurance Program (NFIP) without flood insurance studies. In these cases the FHBM has become a Flood Insurance Rate Map (FIRM) without any accompanying
study to be indexed into the Repository. The notation FIRM, rather than FHB, follows the names of these communities on the county maps.

The Repository listing is comprised of characteristics of all reports in the Repository which contain Information about the communities or the county. For each Repository item the following data are included:

1. Report number (1-998 currently)
2. Report title (abbreviated)
3. Author
4. Entries for each stream covered by the report:
   a) stream name (or proposed name if it is unnamed)
   b) stream mile limits of study
   c) method of analysis
   d) geographic location of downstream limit
   e) priority

A table explaining the abbreviations for authors, report types, and methods is included on the inside front cover.

The list of FPAMs representing the county contains four categories of Information:

1. Streams for which flood-prone area has been defined on the set of maps
2. Names of all quadrangles in the set of maps which show flood-prone area for each stream
3. Map series (7.5 minute or 15 minute) in which each quadrangle occurs
4. Numeric code used at SWS to identify each quadrangle

This list is printed separately from the Repository summary because FPAMs, like FHBMs, are not indexed into the computerized Repository data base.

**Example of Directory Use**

A portion of the directory map for Knox County is shown in Figure 1. The figure is labeled for easy identification of county boundary, FHBM boundary
Figure 1. Example of directory map - Knox County
and panel number, stream, and Community name, location, and notation of corresponding Repository contents. A user searching for Information on Galesburg in Knox County would locate it on the map, note the report numbers following the name, and look up the Information displayed under each report number in the Repository listing immediately following the county map. Wataga is a Community whose only entry in the Repository is an FHBM, while Knoxville is a Community which has undergone Special Conversion to the regular phase of the NFIP, so that its FHBM has become a FIRM without a study. Any Community in the county which does not appear on the map has no Information entered in the Repository.

Updates

This directory will be updated periodically. Updates will consist of listings by county of new reports indexed into the Repository and typed lists of changes to be made to county maps. Users of this directory who wish to obtain Updates should write to SWS at the address shown below, indicating the counties for which Updates are desired.

Illinois State Water Survey
Floodplain Information Unit
2204 Griffith Drive
Champaign, IL 61820
(217) 333-2304

THE FLOODPLAIN INFORMATION REPOSITORY DATA BASE

Before beginning a project or purchasing property near riverine areas, an individual must determine whether and to what extent the area of interest is floodprone. The purpose of the Floodplain Information Repository is to answer requests on matters such as this, using the best available flood hazard Information from the reports on file at SWS. The Repository relies upon the Cooperation of engineers and agencies to provide Information to
SWS. There are currently 998 reports in the Repository.

For each of the 998 reports, bibliographic Information, stream data, and characteristics of analyses have been entered into a computerized data base. Three Computer programs have been written to manage this data base: ENTRY, which indexes the information into the system; CHANGE, which enables correction or alteration of indexed information; and SWAT, which retrieves the data in a format specified by the user. A series of SWAT commands permits a user to search for any combination of bibliographic or stream information items.

The reports in the Repository are divided into nine basic categories. The categories and the total number of reports in each category as of September 30, 1984 are shown in the following tabulation. Definitions of the nine categories follow.

1. Flood Insurance Studies (FIS)

A flood insurance study usually contains results of detailed stream analyses, performed for the Federal Emergency Management Agency (FEMA) under
their guidelines. Products normally include Flood Boundary and Floodway Maps (FBFMs) that show the 100-year and 500-year floodplain and 100-year floodway. Also included are FIRMs which show similar flood boundaries, flood insurance zone Information, elevation reference marks, and flood profiles for the 10-, 50-, 100-, and 500-year floods. In almost every FIS, approximate methods are also used to estimate flood discharges and elevations and floodplain extent for headwaters and tributaries of major streams. Profiles are not plotted for these estimated elevations.

2. Regulatory Floodplain Studies (REG)

These studies include maps and profiles prepared for floodplain regulations administered by the Illinois Division of Water Resources (DWR) under their authority established pursuant to Section 65f, Chapter 19, Illinois Revised Statutes. The studies provide orthophoto contour maps depicting the 100-year floodway and floodplain, as well as 100-year flood profiles including DWR regulatory flood protection elevations (1 foot above 100-year).

3. Flood Hazard Reconnaissance Studies (REC)

These studies are generally furnished by the Soil Conservation Service (under Section 6 of Public Law 83-566), the U.S. Army Corps of Engineers (under Section 22 of Public Law 93-251), and DWR. They provide an assessment of current data on the nature of specific problems and an estimate of average annual flood damages. These studies vary in the degree of detail in which they present floodplain Information. Generally, approximate methods are used.
4. Strategic Planning Studies (SPS)

These studies are the next phase of study for communities that have severe flood problems noted in a flood hazard reconnaissance study. They show much more detail and explore the feasibility of flood control projects.

5. Flood Hazard Analyses (FHA)

These again vary in detail and generally are floodplain studies used for planning purposes. The majority of these are Hydrologic Investigation Atlas maps that show flood boundaries and profiles of historic floods and/or the 100-year flood in northeastern Illinois.

6. Flood Control Studies (FCS)

These studies are generally detailed in nature and include flood profiles and floodplain maps that are the technical basis for planning and design of a flood control project that would lessen the flood hazard.

7. Floodplain Information Reports (FPI)

These are detailed studies of the flood hazard and include profiles and flood boundaries of the 100-year flood and sometimes historical floods or floods greater than the 100-year. These studies were generally prepared by the Corps of Engineers prior to the study efforts of the NFIP and are intended as an aid to local planning and zoning of the flood hazard area.

8. Project Planning Studies (PPS)

These studies vary in the amount of detail given in presenting Information about a flood hazard area. They are prepared in the planning and design of a project that may be impacted by floods, such as a bridge or other drainage structure.
9. Dam Safety Reports (DSR)

These reports are analyses of the ability of a dam to pass the 100-year flood and various percentages of the Probable Maximum Flood. These studies use flood routing techniques to determine the 100-year pool elevation of the reservoir behind the dam.

The priority ranking of the reports indexed into the Repository was developed in an attempt to define objectively the relative reliability of flood elevation data for regulatory purposes. The rankings were based on the detail and application of the selected analytical method and the depth and breadth of the review of results. A thorough discussion of this ranking appears in SWS Circular 137. The priority categories, beginning with the most reliable, are as follows:

1. State-certified data, including FIS data and regulatory data reviewed and approved by DWR;

2. Detailed 100-year flood study data prepared by a federal or State agency but not certified by DWR;

3. Detailed 100-year flood study data prepared by a Consultant;

4. Adjusted flood of record;

5. Observed flood of record;

6. Computations to estimate 100-year flood discharge and elevation to satisfy DWR bridge permit requirements;

7. Computations of approximate 100-year flood discharge and elevation at ungaged Sites using regression equations developed for Illinois by the U.S. Geological Survey.
For publication, the directory has been divided into four volumes. Volume 1 covers the six counties in northeastern Illinois which comprise the Chicago metropolitan area; Volume 2 represents 17 counties in north central and northwestern Illinois; Volume 3 summarizes 32 counties in the central part of the state; and Volume 4 covers 47 counties in southern Illinois. Figure 2 shows the division of the counties into regions represented in the four directory volumes. It also shows the numbers of items found in the Repository for each county.

Two other sources of floodplain information are available in the Repository. These are the FPAMs and FHBMs, previously mentioned as not being indexed into the Information retrieval computer program. The FPAMs are available for most Illinois streams that meet the following criteria:

1) Urban and suburban areas where the upstream drainage area exceeds 25 square miles.

2) Rural areas where the upstream drainage area exceeds 100 square miles.

The flood prone areas outlined on these maps have approximately a 1 percent chance of flooding during any year. U.S. Geological Survey 7.5-minute or 15-minute topographic maps are used as the bases for the maps (Edelen, 1973).

The FHBMs were prepared by FEMA. The FHBMs were developed prior to detailed hydrologic and hydraulic studies conducted as part of the flood insurance studies. The FHBMs were prepared to provide a preliminary indication of areas of probable flood hazard in communities. For towns and counties where flood insurance studies were later completed, FIRMs and FBFMs superseded the FHBMs. However in many areas the FHBMs remain the best available floodplain information. Most flood prone communities and counties in
Figure 2. Distribution of Illinois counties into the four volumes of the directory
Illinois that do not have flood insurance studies have at least had a map of this type prepared. Complete sets of both the FPAMs and the FHBMs are located at SWS.

The Northeastern Illinois Planning Commission (NIPC) maintains a supply of FIRMs of the communities and counties (Cook, DuPage, Kane, Lake, McHenry, and Will) in its jurisdiction. Information for ordering and purchasing these maps may be obtained by writing NIPC at 400 W. Madison, Chicago, IL 60606 or by telephoning (312) 454-0400.

THE ROLE OF THE FLOODPLAIN INFORMATION REPOSITORY

Relevance to State Programs

The Floodplain Information Repository provides data relevant to several state programs. Permits issued by the Environmental Protection Agency require that Sites such as water and waste treatment plants, hazardous waste Sites, and landfill sites be protected from the 100-year flood (flood of a magnitude that would be expected once in 100 years). The Repository can provide relevant Information to designers of such projects.

The Governor's Executive Order IV (1979) requires that any construction project at a state-supported facility be checked to assure that the project is not in a flood hazard area. The Floodplain Information Repository assists State agencies, health facilities, housing authorities, and other parties to comply with this order.

Engineers and architects often need information on the 100-year flood elevation and boundary in order to plan projects and to obtain necessary state and local construction permits. When applying for State permits, mining companies are often concerned about whether their mining activities will be remote from floodplain areas that are unsuitable for mining and need
protection from flooding. The Repository can provide the best available Information regarding these areas.

The principal benefit of the directory to all these users is that it provides a resource anyone may consult to determine what Information is available for a given Site. By referring to the directory, some users can ascertain immediately that no Information exists in the repository for a location, or that the Information they already have is the best available. Others can identify exactly what Information they require, so that their requests directed to SWS may be concise and specific. For all cases the directory serves as a handy reference to assure the quality and to expedite the delivery of floodplain information.

Relevance to Federal Programs

The most relevant federal program supported by the Repository is the NFIP. A function of the Repository is to keep sets of flood insurance studies with maps and profiles so that this information can be provided when it is requested. To obtain this same information from the federal government takes several weeks.

When confronted with the NFIP mandatory requirement to buy flood insurance, prospective homeowners in floodprone areas often request the appropriate floodplain maps and flood profiles to determine if property is within the flood boundary or if it is above the regulatory 100-year flood elevation. As flood insurance premiums increase to reach unsubsidized actuarial rates, the demand for this information is likely to increase.

New rules proposed for the NFIP will require that any new construction in an approximate "A" zone (Special Flood Hazard Area—no elevations provided) must provide a flood elevation before flood insurance can be
purchased, which is mandatory if the mortgage is from a federally insured lender. The Repository generally can provide this Information when it is needed.

One feature of the directory which is aimed directly at a federal issue is the inclusion of panel numbers for the maps covering the unincorporated areas of the counties. These numbers are required information when ordering maps from the FEMA, and they are useful when requesting similar materials from SWS.

**Future Role**

As the federal government shifts control over programs to the state, the State will assume increased responsibility for floodplain management. The Association of State Floodplain Managers has identified appropriate State and federal roles in floodplain management. They have determined that a data repository is an important and necessary state role.

The framework for accomplishing floodplain management responsibilities in the State of Illinois is established with an existing, functioning data repository that can respond to the information needs of those directly involved in the Operation of programs to manage floodplain areas in the State. Again, the importance of the directory is that it constitutes a user-oriented index of the contents of the Repository, which any individual can use to determine the types and amount of information available in a particular area before Consulting other agencies.

**SUMMARY**

The Illinois Floodplain Information Repository is a valuable resource for many users around the state. It was created to provide central storage and easy recovery of a variety of floodplain information for communities and
counties throughout Illinois. The ability of the State Water Survey to furnish Information to users with varying needs has been enhanced by the development of the Repository.

This four-volume directory extends the usefulness of the Repository by making available a geographically-based summary of the Repository contents. The use of the directory should simplify the determination of data availability for a specific location and the evaluation of Information a user already has. Furthermore, it should guide the user in the search for the most current and reliable information for a site, and make greater precision possible in requests for information. This should streamline the process of information transfer from the Repository to the user.

Acknowledgments

Many SWS staff members contributed to this report. Robert A. Sinclair and Mark C. Collins assisted in developing the county maps on the PRIME Computer System. Lisa Miskimen helped in digitizing maps. Tami Thompson helped in the assembly of the directory listings of Repository information and Flood-Prone Area Maps. Word Processing was done by Kathleen Brown, Pamela Lovett, and Becky Howard. Additional illustrations and figure labels were produced by the Graphic Arts unit under the direction of John W. Brother, Jr.

This is an index of the towns included in the northeastern volume of the directory. Beside each town is the page number of the map with that town. More than one page number indicates the town is in more than one county. Since the reports listed in each county will differ, all map pages given for the town should be checked.
